INTRODUCTION

SERVICE SUPPORT

Emissions Warranty

In conformance with 40CFR§1037.120 this apparatus is warranted to the ultimate purchaser and each subsequent purchaser that the tires delivered with this new vehicle will be free from defects in materials and workmanship that cause the vehicle to fail to conform to the requirements of 40CFR§1037 Control of Emissions from New Heavy-Duty Motor Vehicles for 2 years or 24,000 miles.

Engine emissions related items will be free from defects in materials and workmanship that cause the vehicle to fail to conform to the requirements this standard for 5 years or 100,000 miles.

Obtaining Customer Service

Most questions regarding operation or service should be addressed to your apparatus dealer organization. If you are unable to obtain satisfactory assistance, or if your questions remain unanswered, please contact customer service at:

Spartan Fire, LLC
1541 Reynolds Road
Charlotte, MI 48813
880 867 6478
E-mail: www.emergencyresponse.spartanmotors.com

Reporting an Accident

Notify Spartan Fire, LLC., any time your apparatus is involved in an accident resulting in personal injury or death. The company will investigate all such incidents. Never remove, damage, or modify any part of your apparatus that is involved in an accident investigation.

Customer Service must be notified whenever the Side Roll Protection System or Frontal Occupant Protection System has been activated. DO NOT remove or tamper with any Side Roll Protection System or Frontal Occupant Protection System components, except to extricate the occupants.

Safety Defect Reporting

If you believe that your vehicle has a defect which could cause a crash or could cause injury or death, you should immediately inform the National Highway Traffic Safety Administration (NHTSA) in addition to notifying Spartan Fire, LLC.

If NHTSA receives similar complaints, it may open an investigation, and if it finds that a safety defect exists in a group of vehicles, it may order a recall and remedy campaign. However, NHTSA cannot become involved in individual problems between you, your dealer, or Spartan Fire, LLC.

To contact NHTSA, you may call the Vehicle Safety Hotline toll-free at 1-888-327-4236 (TTY: 1-800-424-9153); go to http://www.safercar.gov; or write to: Administrator, NHTSA, 400 Seventh Street, SW., Washington, DC 20590. You can also obtain other information about motor vehicle safety from http://www.safercar.gov.

GENERAL SAFETY

INTRODUCTION

Operator Manuals

This operation and service manual is one in a set of manuals that instructs you on how to properly and safely operate an apparatus. For a complete understanding of the safe and proper operation of your apparatus you must read, study, understand, and follow the information found in each of the manuals provided to you.

These many include the following:

- Custom Chassis.
- Commercial Chassis.
- Aerial Device.
- Pumping System.

These manuals do not replace, nor does their use absolve you from complying with any and all applicable Federal, State, or Provincial regulations, safety codes, operating limitations, fire company procedures or insurance requirements.

Major Component Manuals

Additional safety, operation, and service information is located in the associated major component operation and service manuals. Study the safety information found in all the manuals provided including manuals for the engine, transmission, pump, breathing air system, foam system, generator, and others included in the information provided with the delivery of your apparatus.

Industry Standards and Guidelines.

There are many industry standards and guides that you and your department must follow to safely operate your apparatus including those shown here.

- NFPA® 1911 Standard for the Inspection, Maintenance, Testing, and Retirement of In-Service Emergency Vehicles
- NFPA® 1451 Standard for a Fire and Emergency Service Vehicle Operations Training Program
- NFPA® 1500 Standard on Fire Department Occupational Safety, Health, and Wellness Program
- NFPA® 1962 Standard for the Inspection, Care, and Use of Fire Hose, Couplings, and Nozzles and the Service Testing of Fire Hose
- IFSTA Pumping and Aerial Apparatus Driver/Operator Handbook
- FAMA Fire Apparatus Safety Guide (additional copies available from FAMA.org)
- FEMA Safe Operation of Fire Tankers (downloadable from FEMA.org)
SAFETY

Apparatus Modifications
Modification of this apparatus from its original design without written permission from the manufacturer is strictly prohibited and may result in subjecting personnel to a risk of injury or death. The manufacturer reserves the right to change, improve, modify or expand features of its products at any time, without notice, and without incurring any obligations to change, improve, modify or expand features of previously delivered equipment.

EXTRICATION AND AIR BAGS
Your apparatus may be equipped with occupant roll-over or front crash protection airbags and other pyrotechnic devices that may deploy during a rollover or frontal crash.

In case it is necessary to perform the extrication of an occupant of this vehicle, performing any one of the following will disable the roll or frontal sensors and any unfired protective devices:

- Turn battery master switch to the OFF position, OR
- Move ignition switch to the OFF position, OR
- Disconnect the batteries, OR
- Cut the wires to the protective device actuators.

Fired protective devices pose no toxic threat to rescue personnel. After a side roll accident, the seat belts on all the occupants will be tight, but have specially designed buckles that can be released under belt tension. Use extreme care when releasing seat belt buckles and exiting a damaged vehicle. The bags will be filled with warm inert gases. The gases will be nearly invisible, but will have an acrid smell. The gases pose no harm to occupants or rescue personnel.

TO THE APPARATUS DRIVER/OPERATOR
A custom fire apparatus is not a consumer product; it is a complex piece of industrial equipment. It has the potential to harm you or those around you if you use it improperly. Safe operation requires you to be trained, be experienced, be smart and use your common sense. It is essential that you be careful, physically and mentally qualified, trained in the safe operation of this equipment, and authorized by your fire department to do so.

Never work on or around a fire apparatus, or operate it, unless you have:

- Read and understood this operation and service manual.
- Watched and understood any safety video(s).
- Read and understood any other operation and service manuals associated with your apparatus.
- Read and understood the operation manual(s) of components supplied with this apparatus.
- Read and understood the FAMA Fire Apparatus Safety Guide.
- Read and understood all safety signs posted on your apparatus.
- Been trained in the safe operation of this apparatus in accordance with NFPA 1451 Standard for a Fire and Emergency Service.

2.2
• Been properly trained and are authorized to operate your apparatus.

If you do not feel comfortable with your knowledge, training, level of experience or the adequacy of your personal protective equipment, stop what you are doing and report this to your supervisor. If you feel that the apparatus is not functioning safely, stop what you are doing, report it to your fire department safety officer or fire chief, and do not use the apparatus until the hazardous situation can be resolved.

WARNING

Do not paint over this label. Replace if damaged or lost.

TO THE APPARATUS MECHANIC

Fire apparatus are complex machines made of thousands of parts. As with all machines, they must be constantly maintained and can break down. The safety of the firefighters using your apparatus, as well as the safety of people in your community, depend on frequent and thorough inspection, service and maintenance of your apparatus and its associated equipment. Since you will probably need to operate your apparatus in the course of servicing it, you must be intimately familiar with safe methods of operation as well as safe maintenance practices.

If you do not feel comfortable with your knowledge, training, level of experience or adequacy of your personal protective equipment, stop what you are doing and report this to your supervisor. If you feel that the apparatus is not functioning safely, stop what you are doing, report it to your fire department safety officer or fire chief, and do not use the apparatus until the hazardous situation can be resolved.

Never attempt to service or maintain a fire apparatus unless you have:

• Read and understood the FAMA Fire Apparatus Safety Guide.
• Watched and understood any applicable safety video(s).
• Read and understood this operation and maintenance manual(s).
• Read and understood the operation and maintenance manual(s) of components supplied with your apparatus.
• Been properly trained and are authorized to maintain and operate your apparatus.

TO THE SAFETY OFFICER

NFPA 1521 Standard for Fire Department Safety Officer establishes specific and essential responsibilities for your role relating to the safe operation of fire apparatus in your department. You are expected to participate in the specification of new apparatus to ensure that the apparatus will include safe features consistent with the way your department will operate. You are also expected to monitor your apparatus while it is being used to make sure that the firefighters using your apparatus are doing so in a safe manner.
The highly custom nature of fire apparatus makes your role and responsibilities extremely important. Fire department operations vary greatly and we cannot anticipate all the potential ways your apparatus may be used. It is your responsibility to make sure the ways your department operates are consistent with the instructions in this manual. Where a custom feature is not covered, it is your responsibility to make sure safe practices are established and followed. It is essential that you anticipate the way your department personnel will use your apparatus and how it is actually being used once it is placed in service. A custom feature, or a common feature installed in an uncommon fashion, may present a hazard that was not apparent at the time of manufacture. If you observe anything that you feel is unsafe, it is your responsibility as established by NFPA 1521 to address it. Contact us if you need help and we will work with you to ensure that your apparatus is safe in every regard.

TO THE TRAINING OFFICER

NFPA 1451 Standard for a Fire and Emergency Service Vehicle Operations Training Program establishes specific and essential responsibilities for training in the safe operation of fire apparatus in your department. Personnel must never be allowed to operate an apparatus unless you are convinced that they have been thoroughly trained in its safe operation, and they are experienced enough to operate safely all the time without supervision. They must be trained to operate safely all the time, not cut corners, not operate the apparatus in ways it was not intended, and not be careless with the safety of themselves or others. NFPA 1451, Annex B offers a detailed checklist of potential hazards found on apparatus that every operator must be trained to avoid.

TO THE FIRE CHIEF

As with any piece of complex industrial equipment, your apparatus is designed to be operated only by trained, experienced and sophisticated users. Many fire chiefs have had to deal with tragic outcomes when apparatus have been placed in the hands of poorly trained, inexperienced or undisciplined personnel. Such mistakes can result in injury or death to firefighters, the victims you are intending to rescue or innocent bystanders. It is essential that you support your safety and training officers, foster a culture that promotes safe operation and provide consequences for those who choose not to follow the rules.

Parades and Public Events

Your apparatus is designed for personnel to be transported only while wearing seatbelts. Transporting people who are not seated and belted should never be allowed. Before using your apparatus in parades, educational demonstrations, charitable fundraisers, or other community events where untrained people will be in, on, or around your apparatus you must create a safety plan that will protect them from harm. Before allowing anyone other than a trained and experienced member of your department near your apparatus, you should consult with your fire department safety officer and plan for safety. Be sure to follow all the safety procedures in this manual, and ensure that the event will be conducted in a manner that is safe for everyone involved.

Not Designed for Children

Your apparatus is designed for adult fire fighters and is not suitable for the transportation of children. Your apparatus is compliant to the Federal Motor Vehicle Safety Standards that apply to trucks over 10,000 lbs. These standards expect that operators are adult professions and they do not account for the needs of children. Features including the following may not be appropriate for accommodating children or people of extremely small stature.

- SCBA Seating.
• Seat Belt Accommodations.
• Inflatable Occupant Restraints.
• Power Window Controls.
• Child Seat Attachments.

**Vehicle Data Recorder**

Your NFPA 1901 compliant apparatus includes a Vehicle Data Recorder (VDR). This device allows you to download data from your apparatus that will tell you certain safe driving information such as whether your apparatus is driving too fast, stopping too quickly, or being operated with unbelted occupants. The intention of this device is to assist you in monitoring, training, and enforcing safe apparatus driving practices. Download and use this data regularly to ensure that the personnel under your supervision are operating safely.

**SAFETY ALERTS**

The safety signs found on your apparatus and in this manual use the ANSI Z535 safety alert symbol system. You should be familiar with this system and understand the meaning of each symbol.

**Safety Alert Symbol**

The Safety Alert Symbol means: “ATTENTION! STAY ALERT! YOUR SAFETY IS INVOLVED!”.

![Safety Alert Symbol]

The Safety Alert Symbol identifies important safety messages on your apparatus, on your equipment, on safety signs, in manuals or elsewhere. When you see this symbol, be alert to the possibility of death or personal injury. Follow instructions in the safety message.

**Signal Words**

Signal words are intended to alert you of a potential hazard, the general severity of the hazard and that a message will follow which will provide instruction on how to avoid the hazard.

<table>
<thead>

</tr>
<tr>
<td>🚨 WARNING 🚨</td>
<td>Indicates a hazardous situation which, if not avoided, MAY result in death or serious injury.</td>
</tr>
</tbody>
</table>
SAFETY

CAUTION

Caution: (without safety alert symbol) Indicates a situation which, if not avoided may cause equipment damage.

FOLLOW A SAFETY PROGRAM

Turnout gear is important any time you are operating on or around your apparatus. Your fire apparatus is heavy equipment, and PPE is appropriate any time you are using it.

You may need:

• Boots.
• Helmet.
• Heavy-duty gloves.
• Reflective clothing.
• Hearing protection.
• Safety glasses, goggles or face shield.

Always Be Alert

As a first responder you are trained to be situationally aware. This means you are always looking out for what is around you even in the midst of an emergency. This awareness is just as important during mop-up, training, testing, cleaning, service, maintenance or any other time you are working in, on or around your apparatus. Don’t be tempted to forget the importance of being aware and alert when there is no emergency. Many injuries occur during routine operations when your guard is down. You may be tempted to relax around the apparatus when performing tasks you have done many times before. Avoid this temptation. Your equipment must be respected at all times for your safety and the safety of those around you.

Be Careful

Mistakes are more likely when you are tired, distracted, or overwhelmed. Call in extra assistance and let someone else take over if you become fatigued or ill. Never operate on or around your apparatus under the influence of drugs or alcohol. Operating your apparatus in an un-well condition can lead to death or injury for you or others.

Know the Rules

Your department will have rules and procedures to keep you safe. These must include the instructions in this manual. Know the rules and follow them. If you find a conflict in the rules work with your department’s safety officer to resolve the conflict.
Commercial Driver’s License Course

Your state may exempt you as a firefighter from the requirement to hold a commercial driver’s license (CDL), but the rig you are driving may be bigger and heavier than most other trucks on the road. Commercial drivers must learn the right way to inspect and operate heavy trucks and demonstrate their abilities before they are issued a license. Consider taking these courses and obtaining your CDL even if not required to do so by your department. You will learn valuable safety tips, demonstrate your skills and feel more confident behind the wheel of your apparatus.

Practice Safe Practices

It is not enough to simply be instructed on safe apparatus operation. Consistently safe operation happens because you know how to operate safely and have practiced safe operation long enough to establish safe habits that are committed to both your mental memory and your muscle memory. Never cut corners in safety during practice sessions to avoid unintentionally cutting corners during an emergency.

Safety Signs

Read and understand all the safety signs on your apparatus before you operate the equipment. They communicate the most critical safety messages, but they are meant to remind only. You should know, memorize, and follow the instructions without needing to read them during operation.

Operate Only What You Know

Your apparatus may have unique characteristics or features that were custom ordered by your department. Other apparatus in your fleet may have different unique characteristics or features. Only operate an apparatus that you are completely familiar with and that you have been trained and authorized to use safely.

Operate Only Well Inspected Apparatus

Your apparatus must be in excellent working order at all times if you are going to ensure your own safety and the safety of others.

Follow the NFPA 1911 Standard for the Inspection, Maintenance, Testing and Retirement of In-Service Automotive Fire Apparatus and your manufacturer’s operation and service manuals to keep your apparatus safe for operation. These publications will tell you what to check, what to test, how often they need to be checked or tested, and when you should remove your apparatus from service.

Your apparatus should be inspected thoroughly on a regular basis. Study the inspection criteria found in this manual, the other applicable operator manuals, the decals and markings on the apparatus itself, and your State’s commercial driver’s license pre-trip inspection requirements. Determine how each requirement will apply to your apparatus and consolidate this data into a single pre-trip or start-of-shift inspection. Determine when and by whom the inspections will be performed, make sure these individuals are trained and qualified to perform the inspections, and establish a regular inspection schedule. Make sure you perform each inspection in teams of two, with one person operating interior controls while the second person is checking for exterior functions such as turn signal lamps, flashers, brake lights, etc.

Record all deficiencies in compliance with NFPA 1911 Standard for the Inspection, Maintenance, Testing and Retirement of In-Service Automotive Fire Apparatus. Review the previous inspection report at the start of each shift to ensure that any deficiency that was noted by the previous crew has been resolved.
GENERAL HAZARD IDENTIFICATION

Your apparatus will have safety signs warning of the more common hazards, but not every hazard will be identified with a safety sign. You must use your common sense. Look for and avoid these general hazards. Study your apparatus to identify each hazard and develop methods of avoiding each. It is best to make this a written plan so that you can share it with all the personnel who may be working on or around your apparatus.

Pinch and Crush Hazards

Look for places where there are moving parts such as folding steps, aerial ladders, rollout shelves, aerial turntables, stabilizers, cab and compartment doors, etc.

Rotating Parts Hazards

Common rotating parts include; drive shafts, power take-off shafts, cooling fans, compressors, generators and hose or cord reel drives. Do not wear loose clothing or other items that could get tangled in the shafts or fans. Many rotating parts can begin to spin without warning; therefore, treat each hazard as if it were spinning already.
Hot Parts Hazards

Common hot parts include; engine, exhaust, air compressors, water pumps, air conditioning compressors, foam pumps, line voltage generators, and fuel-fired heaters.

Diesel engines equipped with diesel particulate filters require regeneration that involves high heat. The exhaust system can get extremely hot without warning. Keep away from exhaust gas and do not park your apparatus where the exhaust pipe points toward or near flammable material.

Exhaust Fumes

Internal combustion engines give off hazardous fumes while running. Never run your apparatus engine inside a building unless the exhaust discharge is connected to an extraction system. Diesel engine exhaust and some of its constituents are known to the State of California to cause cancer, birth defects and other reproductive harm. Do not operate any internal combustion engine in an area where exhaust gases can accumulate or serious injury or death may occur. If exhaust fumes are suspected of entering the vehicle cab, rectify the defect immediately. Do not perform a DPF regeneration inside a building. Do not stay inside your parked apparatus cab for extended periods of time with the engine running as exhaust fumes could seep into the cab causing illness or death.
Chemical Exposure

Your apparatus could expose you to chemicals that the State of California has determined can cause cancer. Avoid exposure to these chemicals including Diesel Exhaust, Gasoline Exhaust, and Gasoline Vapors. Check with the California website to learn more at https://oehha.ca.gov/proposition-65/chemicals.

![WARNING]

This product can expose you to chemicals including but not limited to Diesel Exhaust, Gasoline Exhaust, or Gasoline Vapors, which are known to the State of California to cause cancer. For more information go to www.P65Warnings.ca.gov.

Fire

Your apparatus is composed of many parts that can catch on fire. These include fuel, oils, plastics, rubber, vinyl and cloth. It also has a source of ignition in the form of batteries and electrical wiring. Chaffed wires can cause heat or sparks that can start a fire. Avoid parking your apparatus, or any other motor vehicle, inside any structure that has common walls with a sleeping area. Install fire alarms and sprinklers in garage bays. Make sure that your apparatus is well maintained and that hot components and wire harnesses are kept free of grease, oils and other contaminants. Clean all build-up of oily or greasy dirt that can burn and spread a vehicle fire quickly.

If your apparatus catches on fire while driving:

- Bring vehicle to a complete stop as quickly as possible.
- Apply parking brake.
- Shut down engine.
- Turn off master power switch.
- Leave vehicle.

Electrical Shock

Your apparatus may be equipped with line voltage capability (120 V, 240 V, etc.). Common sources of line voltage include invertors, gas or diesel generators, generators driven by power-take-off shafts from the main engine, or hydraulically powered generators. You will also have line voltage on board while you have your apparatus plugged in to shore power.
Noise

Your apparatus may be equipped with audible warning devices that create loud noise to clear traffic. There may be local and state laws in your area governing the use of such devices. Use the city horn instead of the air horns and sirens unless needed.

Sirens produce loud sounds that may damage hearing:

- Roll-up windows.
- Wear hearing protection.
- Use only for emergency response.
- Avoid exposure to siren sound.

Do not operate sirens or air horns with personnel standing in the immediate vicinity (within 50 feet) of the front of your apparatus.

Always use hearing protection such as ear plugs, muffs, or noise canceling intercom headsets to keep your noise exposure within the following NIOSH recommended limits.

Table 2-1: NIOSH Recommended Noise Limits

</tbody>
</table>
Establish a departmental hearing conservation program to monitor the hearing levels of fire department personnel in accordance with the guidelines found in *NFPA 1500 Standard on Fire Department Occupational Safety, Health and Wellness Program*.

Your apparatus is equipped with noise suppression components as part of the engine emissions system and powertrain. Do not remove or disable noise suppression components for any purpose other than maintenance, repair, or replacement.

**Undercarriage**

Use special caution if you need to be underneath your apparatus for any reason. The bottom of your apparatus is not designed to be an operational area, and there are many hazards you will encounter including rotating drivelines, PTO shafts, hot exhaust, pumps, and components which may emit hot steam or chemicals. Inform others and use lock-out tag-out procedures before working beneath your apparatus.
CUSTOM CHASSIS SAFETY

Understand Your Operating Environment

Know Your Response Area

Your apparatus is higher, heavier, longer, and wider than many other vehicles on the road. State and Federal regulations allow fire apparatus to have higher axle weights than other commercial vehicles. These factors mean that you need to be more careful than other vehicles about where you can safely operate.

Drive your streets in your apparatus and plan your routes around the size, weight, and capability of your apparatus.

NOTE: Any areas where your apparatus should not be driven. Plan response routes to cover your district while avoiding these hazards.

Pay special attention to the following:

- Road weight limits.
- Bridge weight limits.
- Low overhead wires.
- Low trestles, bridges, and under-passes.
- Low traffic signals.
- Railroad crossings.
- Cul du sacs, dead ends, and turn-arounds.
- Narrow roads and alleyways.
- Narrow roads with steep drop-offs or soft shoulders.

Know Your Climate

Like any other machine, fire apparatus may require special consideration in inclement weather. High winds, freezing rain, flooding, snow, ice, as well as extreme heat or cold, can all present special challenges to safe operation. Think about the types of extreme weather common to your area and make a list of the special hazards these may present. You will find many weather related precautions throughout this manual. Identify special procedures to counter extreme conditions and practice them while in good weather so that you know what to do when nature turns against you.

Know the Rules of the Road

Your local laws may allow you more road privileges than the general public, but they do not change the laws of physics. You must know the limitations of your apparatus, respect these limitations and drive defensively at all times. Your apparatus is a heavy vehicle that will take more time to accelerate, more distance to stop and is less stable in turns than your passenger vehicle. Heavy axle weights will make it more likely that if you wander onto a soft shoulder you will be drawn off the road and into a ditch. Always drive your apparatus safely and deliberately. The few extra minutes you save running the red light or driving fast through the curves will be lost if you don’t arrive safely.
Check the operation of your lights and sirens prior to the start of each shift. Do not rely on your audible and visual warnings to clear the right of way. People may not hear, see or heed your warning signal. You must recognize this fact and continue driving cautiously.

**Traffic Signal Capturing**

Your apparatus may include a system that works with your local traffic control signals to increase the potential that you will always get a green light at a controlled intersection. While such systems are useful to improve your response time, they are not foolproof. Like any mechanical or electrical system they are susceptible to failure. It is also possible that your apparatus gets pre-empted by another emergency vehicle with a higher priority. You should, therefore, never assume that you will get a green light. Always obey traffic signals.

**SECURING EQUIPMENT**

**Secure Interior Equipment**

If your apparatus crashes it will stop quickly, but items inside the cab will keep going at the speed the apparatus was traveling prior to the crash. Only store items in a cab that can be secured in compartments or in strong brackets. The compartment or bracket should be able to hold the item even if you pull on it with a force equal to nine times its weight.

**WARNING**

Flying Object Crash Hazard
All equipment required to be used during an emergency response must be securely fastened.
Loose items may injure or kill during a crash.

**Secure Exterior Equipment**

Ground ladders or other equipment that falls off your apparatus can injure or kill drivers or pedestrians in your path. Make sure that every compartment door is closed and secured and every piece of equipment is locked in its bracket before you drive away. Inspect compartment door hardware and equipment brackets regularly to make sure your equipment stays on the apparatus where it belongs.
Crush or Crash Hazard.
Always restrain ladders or equipment securely when in the rack.
Never leave loose.
Failure to comply may injure or kill.

WARNING
Do not paint over this label. Replace if damaged or lost.

Crush or Pinch Hazard.
Before operating equipment rack;
Clear area of all people.
Stay clear of path.
Failure to comply may injure or kill.

WARNING
Do not paint over this label. Replace if damaged or lost.

Restrain Hose

Your apparatus includes a hose restraining method for all your designated hose storage areas. Hose that falls off your apparatus can injure or kill drivers or pedestrians in your path. Never drive your apparatus without the hose restrains securely in place.

Entanglement Hazard
Secure hose and other equipment before placing vehicle in motion.
Loose hose may drag behind vehicle and injure or kill.

WARNING
Do not paint over this label. Replace if damaged or lost.
WORKING ON TOP OF YOUR APPARATUS

Slips, trips and falls are one of the most common ways of being injured when working around your apparatus.

Avoid Climbing and Walking on Top

Avoid the need to climb on your apparatus by locating items you need to access during emergency operations in compartments that can be reached from the ground. Store equipment above ground level only that you can access in the station or other controlled environment where you can use safety ladders, lifts, or use fall protection equipment to retrieve them.

Clean From the Ground

Perform routine windshield, cab glass, and mirror surfaces from the ground using brushes and squeegees mounted on extension poles. When better access is necessary for washing the entire apparatus use platforms, safety ladders or other means to avoid climbing on wet slippery surfaces.

Use Three Points of Contact

Three points of contact means you have one hand and two feet, or two hands and one foot in contact with the vehicle at all times. If you can’t find sturdy features to provide three points of contact, have the vehicle modified or repaired. When climbing, it is very difficult to maintain three points of contact without facing the vehicle. Always face your apparatus when getting on and off. Backing out is much safer.

Clean and Repair

Keep steps, walking surfaces, hand rails and shoes free of grease, mud, dirt, fuel, ice and snow. Inspect your apparatus steps, walking surfaces, and handrails frequently. If defects are found remove the apparatus from service until repairs can be made.

Slip Resistant Surfaces

The NFPA standards specify the performance that slip resistant surfaces must meet. Only step or walk on surfaces that are slip resistant. If you must walk or work on a surface that is not slip resistant, do so only in a controlled environment using fall protection equipment. In addition to fall restraint devices, use rubber mats or other means to keep you from slipping.
Designated Stepping, Standing and Walking Surfaces

If your apparatus was contracted for after January 1, 2016, it will have designated standing or walking surfaces at any location above 48 inches from the ground where you may need to access during normal operation.

You can tell which surfaces are designated for standing or walking as follows:

- The surface will have a slip resistant surface. (Except for hose storage areas). AND....
- The surface will have a yellow or orange line surrounding it. OR...
- The surface will have railings or structure at least 12 inches high surrounding it.

Do not stand or walk on any feature of your apparatus that is over 48 inches above the ground unless it meets these criteria. Any surface over 48 inches high that does not meet these criteria must only be accessed using service ladders and a fall protection system or other safe means as determined by your fire department safety management personnel.

WARNING

Fall Hazard
Do not stand or walk on any part of this apparatus that is higher than 48 inches (1.2 m) unless it has:
- A slip resistant surface,
  AND...
- Railings or structure at least 12 inches high surrounding it,
  or a yellow or orange line around it,
Failure to comply may injure or kill.

Some surfaces, such as diamond plate or tread plate may be used in construction of features that are not intended to be walked on. It may be used for aesthetic appeal, or to protect painted surfaces from wear. Just because a surface is constructed of diamond plate or tread plate does not mean that it is designated to be walked or stepped upon.
Folding Steps or Ladders

Certain steps or ladders may be of a pivoting or folding design. They may deploy automatically, or they may need to be deployed by hand. In either case, make sure they are firmly engaged in the weight bearing position before using them. Also make sure they are stowed again before placing the vehicle in motion.

Open Compartment Doors

When climbing or walking on the vehicle, never step on a horizontally hinged cover or compartment door that has been left open. Hold-open devices are not designed to support more than the weight of the door itself. Also, never step on the edge of a vertically hinged door that has been left open. In either case the doors will move and you are likely to fall.

Working on Top of the Apparatus

For those times when working on the top of your apparatus is unavoidable, you must use extra precaution from the moment you leave the ground.

- Stay away from the edge.
- Always use three points of contact.
- Only step on surfaces that are slip resistant.
- Never step on open, horizontal compartment doors.
- Never step on open, vertical compartment door edges.
Climbing Prohibitions

Do not step or climb upon any vehicle surface unless it is slip resistant and handholds are provided. Never climb using features on your apparatus such as lights, sirens, inlet or outlet valves, controls, compartment doors, or other non-climbing features.

Working Around the Apparatus

Open compartment doors that extend out from the vehicle may create a head-strike hazard to others working in the area. Take the time to close compartment doors after you have retrieved your equipment. This goes the same for other items that hang off the apparatus such as deployable ladder racks, slide-out shelves, hose trays, portable tank racks, etc. If you are working at night, be sure to light up the area to reduce the risk of running into things.

• Use scene lights during night operation.
• Always wear your fire helmet when working around your apparatus.
• Keep compartment doors, trays and equipment racks closed or stowed when not in use.

RIDE SAFELY

Cab Capacity

Your apparatus cab is designed to carry a maximum number of occupants while it is motion. Never place the apparatus in motion with more than the maximum number as designated on the label in the cab and never without every occupant seated and belted.

WARNING

This vehicle has a seating capacity of _____ personnel.
Carrying additional personnel may result in death or serious injury.

Seat Belts

Wearing your seat belt is the single most important thing you can do to keep yourself safe while riding in a fire apparatus. Put your gear on before you ride or plan to put it on after you arrive on the scene. Follow these rules to minimize your risk of injury during a crash:

• Always wear a seat belt when the vehicle is in motion.
• Ride with the seat back upright and your lap belt snug and low about the hips.
• Keep your shoulder belt snug against your chest.
• Never wear your shoulder belt under your arm or swing it around your neck over the inside shoulder.
• Never use a single belt for more than one person or one seating position.
• Place your seat belt inside the cab before closing the door.
• Have your belts replaced if they are damaged or worn.

**WARNING**
Crash Hazard
Occupants must be seated and belted when vehicle is in motion.
Use only OEM approved belts.
Unbelted occupants are at greater risk of injury or death in a crash.

---

**Seat Back Position**
Do not drive or ride with your seat back reclined. Your seatbelt may not function properly in a crash if the seat is reclined.

**Shoulder Belt Positioning**
If your seat belt is equipped with a height adjuster, use it to move the shoulder belt into the proper position as shown.

**Safest Posture**
Seat belts provide the best restraint when:

• Seat back is upright.
• Occupant is sitting upright; not slouched.
• Lap belt is snug and low on the hips.
• Should belt is snug against the chest.
• Knees are straight forward.

**Seatbelt Sliding Komfort Latch®**

Your apparatus seat belts may be equipped with the Sliding Komfort Latch that allows you to introduce a small amount of slack in the belt to relieve pressure on your chest while driving.

• Do not introduce more than 1 in. (25 mm) of slack when using the Sliding Komfort Latch®.
• Using the seat belt with too much slack can reduce its effectiveness during a crash.
• Always disengage the Sliding Komfort Latch® when removing the seat belt to allow the seat belt to fully retract.

**Transporting Children**

Your apparatus occupant protection systems are designed to accommodate adult firefighters who may be wearing protective gear. It is not designed for transporting children. Do not transport children in your apparatus, they should be transported in appropriate passenger vehicles only.

**Seats Without Seat Belts**

Your apparatus may be equipped with work areas that include seats without seat belts. These seats are meant to be used only when the apparatus is stopped with the parking brake applied and the wheels properly chocked. If the seats are in an area of the apparatus that is occupied during driving, make sure they are either bolted down or otherwise secured so that they do not become a projectile in a crash.

**WARNING**

Do not paint over this label. Replace if damaged or lost

**Swivel Seats**

Your apparatus may be equipped with a seat that can be swiveled. The seat may be provided with multiple locking positions. Select the proper seating orientation before the vehicle is placed in motion and ensure that it is thoroughly engaged in the locked condition.
**Air Bags**

Your apparatus may be equipped with inflatable occupant restraints (air bags) that inflate if the apparatus rolls onto its side. Your apparatus may also be equipped with inflatable occupant restraints that inflate during a frontal crash. These air bags will only be effective in helping to protect you in a crash if you are also wearing your seat belt. Your seatbelt and associated safety devices will position you to allow the air bags to be effective in a crash.

If your apparatus is equipped with both air bags and suspension style seats, then the system will include a device for pulling the suspension seat down to its lowest position prior to the air bag inflating. This will happen in a split second.

If your apparatus is equipped with air bags, you must learn where they are, where they will deploy and what other devices will deploy in a crash.

Always follow these rules:

- Learn where each air bag on the vehicle will deploy.
- Do not place objects in the path of an air bag deployment.
- Do not cover seats with clothing or other items that will interfere with air bag deployment.
- Keep items and body parts away from the path of the suspension seat mechanism and seat belt tensioning devices.

Failure to follow these precautions may increase the risk of death or injury in a crash.

**Helmets**

Fire helmets are designed for a specific purpose and are not intended to provide protection in a crash. Wear your fire helmets when working around your apparatus, but do not wear it when your apparatus is in motion. Use approved helmet holders or other means of restraining your helmet in the event of a crash.
SCBA Storage

Your apparatus may be equipped with SCBA storage in the seat backs. Some SCBA storage devices must be adjusted to the specific SCBA bottle size or SCBA pack make or model. Make sure the bracket is adjusted properly and that any straps, buckles or latches are fully engaged so that the pack will not come loose during a crash. Leave your pack straps off or keep them loose while sitting in the seat as the bracket is not designed to take the weight of both you and your pack during a crash.

Before placing your apparatus in motion:

- Ensure SCBA bottles and packs are properly secured.
- Use seat back insert in seats were SCBA pack is not being stored.
- If wearing the SCBA harness, make sure it is loose.
- Place movable headrests in the closed position.
- Adjust SCBA holders for the SCBA pack make, model, and size.

SCBA Pack Buckles and Receivers

Your SCBA pack harnesses may be equipped with buckles and receivers that are similar to the buckles and receivers of your seat belts. Take care to ensure that you do not mistake one for the other. You will not be protected during a crash if the seat belt buckle is inserted into your SCBA pack receiver or vice versa.
DRIVE SAFELY

Controls Adjustment

It is important to keep your driving related controls properly adjusted for the person who will be driving. Make your adjustments at the start of your shift, and never make adjustment while driving. If you must readjust while driving, pull over when it is safe, stop the vehicle, place the transmission in neutral, apply the parking brake, and then make adjustments safely.

Adjust all controls prior to driving including the following:

- Steering wheel.
- Driver seat.
- Mirrors.
- Seat belt.
- Sun visor.

Driver Seat Adjustment

Adjust your driver seat at the start of your shift. Do not adjust seats with apparatus in motion. To obtain best ride quality, adjust suspension seats to the center of their vertical travel. Ensure proper reach to steering wheel and pedals.

Mirror Adjustment

Adjust seat before adjusting mirrors. Adjust your mirrors at the start of your shift. Adjust mirrors in a way that will optimize visibility to the sides and the rear. Using a partner, have them walk around the sides and the rear of the vehicle to determine where the blind spots are. Make sure any exterior view cameras are pointed properly and that their lenses are clean and unobstructed.

- Know your blind spots.
- Adjust seats and mirrors at the start of every shift or before driving.

Visibility Check

Ensure that you have excellent visibility using the following checklist:

- Windshield glass is clean.
- Cab side glass is clean.
- Mirrors are clean.
- Rear, side, or birds-eye cameras are clean and functioning.
- Windshield wipers function and blades are in a condition to wipe thoroughly.
- Washer fluid reservoir is full with commercial non-freezing washer fluid and washer sprayer is functioning.
Seat Belt Monitoring

Your apparatus includes a seat belt monitoring system that will alert you when an occupant is sitting in a seat but has not buckled their seat belt. Always check this monitor and do not release the parking brake until all occupants are seated and belted.

Know Your Tire Limitations

Fire apparatus axle weights are often higher than typical heavy trucks. Tire manufacturers recognize the need for fire apparatus to carry higher loads and that in most cases a fire apparatus does not travel at high speeds for long periods of time. Tire manufacturers will rate some of their tires with a special “fire service” intermittent duty rating. This allows the tire to carry greater loads or attain higher speeds as long as it does not have to do so for extended periods of time. To avoid tire degradation, fire service rated tires have limits on the amount of time they can be driven at high speed and high load before they must be allowed to cool down. Study your tire ratings, compare them to your in-service tire loads and know the speeds you can operate and any cool down periods that may be required.

FEMA Fire Tanker Guidelines

The US Fire Administration’s “Safe Operation of Fire Tankers” report is available as a pamphlet from FEMA, or it is available as a download from their website. Read this report completely, learn about the precautions and techniques it describes, and practice driving your fire tanker or tender safely. This report can be downloaded from the FEMA website at www.usfa.fema.gov.

Liquid Loads and High Center of Gravity

If your apparatus includes water, foam or other fluid tanks, you must take special precautions while driving. Liquid surge results from the movement of liquid in a partially full tank. There are two common times when liquid surge becomes a problem. The first is when you change directions, such as when negotiating a curve in the road. If you enter the curve too fast, centrifugal force will cause the liquid to surge against the wall of the tank and push your apparatus away from the turn. In severe situations, this surge can be sufficient to push you off the roadway or cause you to rollover.

Liquid surges will also affect your apparatus when stopping. During braking, the liquid surges toward the front of the tank. This additional force surging forward can further increase the stopping distance of your apparatus. After you come to a stop, the liquid in the tank will continue to slosh back and forth. On slippery road surfaces, this could cause your apparatus to be pushed forward into a hazard such as an intersection or a railroad crossing.

Whenever possible, do not drive with partial water loads. Keep the water tank full or empty when driving.
In addition to the hazard of a liquid load, your apparatus has a higher center of gravity (CG) than a passenger vehicle. A high CG makes your apparatus more likely to roll over in a turn. Never exceed the posted cautionary speed limit.

These combinations of factors mean that you need to slow down and be extra careful when making maneuvers such as:

- Lane changes.
- Curves at highway speeds.
- Tight radius turns.
- Downgrades leading into ramps.
- Curves on roads without a bank.
- Tight radius exits and off-ramps.
- Driving on any road with a cautionary speed limit posted.

**Driving on Rough Roads**

Your apparatus is primarily designed to operate on smooth paved surfaces. Driving on un-paved or poorly maintained roads will require you to slow down and proceed with caution. Your seating systems may not compensate for severe road conditions leading to injury. Slow down and use caution prior to encountering severe road conditions such as:

- Potholes, ruts or sinkholes.
- Speed bumps.
- Railroad crossings.
- Road construction.

**Driving Off-Road**

When you leave the public roads you must take extra precautions to ensure the safety of yourself, your vehicle, and those around you. It is likely that your apparatus has higher axle weights than typical off-road capable trucks and will be more susceptible to sinking into soft soil. A fluid load and higher center of gravity also require additional caution.

Know the capability of your apparatus and follow these guidelines:

- Always drive straight up or down a hill; never drive sideways on a hill.
- Get out and look. Walk the terrain before proceeding into unknown conditions.
- Check off-road conditions in your response area ahead of time so that you will know what to expect.
- Stay clear of excavations that are not properly shored up. Stay as far away from an excavation as it is deep (One to one ratio rule).
- Look for off-road hazards such as marshy areas, buried culverts, private bridges, animal dens, or other features that may not support your weight.
One-to-One Ratio Stay-Away Rule

No-Spin Axle Differential

Your apparatus may be equipped with a No-Spin differential or differential lock. With this feature engaged, use extreme caution when accelerating or decelerating on slippery or unstable surfaces. Vehicles equipped with traction or locking differentials are inherently more sensitive to side-slip.

Operate in low gear when coasting downhill into a turn. Braking capacity is reduced when a No-Spin or locking differential equipped vehicle makes a turn while coasting downhill.

Tire Chains

Never install tire chains on the steer tires. Installation of tire chains on the front tires may cause extensive damage to the cab as well as safety critical parts of the steering and brake systems. Damage to these components may lead to serious injury or death.

Water Fording

Your apparatus is not designed for operation in deep water. Your apparatus is capable of fording fresh stationary water at a depth not to exceed the center of the tire at slow speeds and for short distances only. Fording deeper water, at faster speeds, and for longer distances, can damage apparatus components leading to equipment failure, loss of apparatus capability, and expensive repairs. Never drive into flowing water like flash floods, rivers, creeks or streams. Flowing water has tremendous power and can sweep your apparatus away.

Components that will be affected by high water operation include:

- **Engine air intake** – Water in the air intake will cause the engine to stop and may cause extensive damage.

- **Drive Axles** – Breathers on the top side of drive axle housings can ingest water causing axle gear damage.

- **Engine Fan** – Operating in high water can cause fan blade damage.

- **Electronics** – Connectors, wiring, electronic modules, can be damaged or shorted out by submersion.

- **Batteries** – Submersion of the apparatus batteries will kill the batteries and stall the engine.
Operation in salt water will cause damaging corrosion and lead to equipment failure. Always know the depth of water before proceeding.

**Heater Shut-Off Valve**

Your apparatus may be equipped with a heater shut-off valve. This valve may have been specified by your department to ensure that there is no hot coolant supplied to the cab heater core during hot seasons of the year. Use this valve with caution and make sure it is open whenever needed. Use of the heater shut-off valve will prevent warm air from circulating through the defroster system and may lead to a reduced ability to clear humidity from the windshield and subsequent reduced driver visibility.

**STOP SAFELY**

**Brake System Pressure**

Your apparatus braking system relies on air pressure created by a pump that runs off the apparatus engine. Do not release the parking brake and move the vehicle until the front and rear air gauges indicate at least 60 psi in both circuits. 100 psi is preferred for maximum stopping capability.

**Anti-Lock Brake Systems**

Your apparatus is equipped with an anti-lock braking system (ABS). ABS monitors the rotation of the wheels and pulses the brakes when it senses a skid. This can help you maintain control in during a stop. ABS can greatly increase the control you have when stopping on wet or slippery surfaces, but it cannot provide more braking performance than the road conditions will permit. Your apparatus is big and heavy and should always be operated with caution knowing that it takes a lot of energy to bring it to a stop.

**Maintaining Control**

- Do not pump brakes on vehicles equipped with ABS. Anti-lock type brakes pulsate to prevent lock-up. Pumping brakes defeats the anti-lock function.
- Hold the steering wheel with both hands on opposite sides of the wheel.
- Always look 12 to 15 seconds ahead of where you are driving.
- Ensure adequate distance between the vehicle you are driving and the vehicle ahead. Braking distances can double when the vehicle is loaded.

**New Brake Lining Performance**

If your apparatus has had its brake linings replaced, they will need to be broken in before they will perform as well as the old linings did. Brake linings need to be “burnished” after installation. This is the process of wearing the high spots off the linings so that they grab over their entire surface. Be alert to any service work on your apparatus involving brake lining replacement and adjust your driving accordingly. The vehicle’s stopping distance and the capability of the vehicle to hold on a specific grade may decrease temporarily whenever new brake lining material is installed.

**Quick Build-Up Air Brake Pressure System**

Your apparatus may include a quick build-up air brake feature as required by NFPA 1901 Standard for Automotive Fire Apparatus. The quick build-up feature allows the vehicle to be driven even though the front air brake reservoir may not have sufficient air pressure to enable sustained or full force braking.
While this is a requirement of the NFPA standard, it is not recommended ever beginning to drive your apparatus without the air reservoirs fully charged. If you chose to make use of the quick build-up feature you must drive slowly and cautiously until your brake reservoirs are charged to above 60 psi.

You can reduce the risk of leaving for on a call with low air pressure by always connecting the air brake system to an external air supply whenever it is in the station.

**Auxiliary Braking Systems**

If your apparatus is over 36,000 lbs. GVW, it will be equipped with one of the following auxiliary brake systems:

- Allison transmission retarder.
- Telma electromagnetic retarder.
- Jake Brake.
- OEM Engine Compression brake.
- OEM Exhaust brake.

All of these system apply braking force through the drive wheels only.

During slippery road conditions or inclement weather, an auxiliary braking system may cause rear wheel lock-up and loss of vehicle control. Turn your auxiliary braking system(s) off before encountering slippery conditions.

If you forget or fail to turn off your auxiliary brake in slippery conditions and begin to lose control, apply the service brakes and make a safe stop. If the ABS senses a loss of braking control it will disengage the auxiliary brake and initiate an ABS event, helping you maintain control.

**Descending Steep Grades**

You should use a combination of service brake application, transmission down-shifting, and auxiliary braking when descending a steep grade. Anticipate steep grades and downshift before you begin to descend. Downshifting to a lower transmission range increases engine braking and helps you to maintain control. Apply the vehicle brakes or other retarding device to prevent exceeding engine governed speed in the lower range selected. Service brakes can overheat and lose effectiveness if used too much. To help avoid loss of control, use a combination of downshifting, braking, and other retarding devices.

**Electronic Stability Control**

Your apparatus may be equipped with an Electronic Stability Control (ESC) system. This system knows which direction you are pointing the wheel and pumps the brakes appropriately to help point the apparatus in the direction that you are turning. This system is most effective on slippery surfaces.

ESC cannot prevent accidents or loss of control of the vehicle. You can still exceed the physical limitations of the system with either excess speed or extreme cornering, causing a loss of directional control or rollover.
Parking Brakes and Wheel Chocks

Your apparatus has a parking brake knob that must be engaged any time you leave the driver’s seat. You must always place the transmission in Neutral (N) and then engage the Park Brake. As soon as you leave the cab, you must chock the wheels. Wheel chocks will help keep your apparatus from rolling in the event that the parking brakes malfunction or are released unintentionally.

Auxiliary Front Wheel Lock

Your apparatus may be equipped with an auxiliary front wheel lock system. The auxiliary front wheel lock feature uses air brake system pressure to keep the front brakes applied while parked. This system uses air pressure (rather than a passive spring) to keep the front brakes engaged and should only be used with the engine running and a qualified attendant present at all times. This feature is meant to enhance the parking performance of the vehicle, but it does not take the place of the spring brakes or the act of chocking the wheels. Always use wheel chocks.

Backing Your Apparatus

According to the National Safety Council, one out of four vehicle accidents can be blamed on poor backing techniques. Avoid backing hazards by planning ahead and avoid situations where you will need to back up:

- Choose pull-through parking spaces.
- If parking in an alley, back into it so that you are pulling forward onto the street when you leave.

Before backing:

- Get to know your vehicle’s blind spots. In a typical truck, blind spots can extend up to 16 feet in front of and 160 feet behind a vehicle. Use a helper who can walk around your vehicle while it is parked to get to know when you can and cannot see them. Remember, mirrors can never give the whole picture while backing.
- Check for people, children or obstructions in the area.
- Check for soft soil, potholes, tire hazards, low hanging trees, powerlines or other dangers.
- Agree with your spotter that they will use hand signals and make sure your both understand their meaning.
- Equip spotter with reflective vest or other reflective gear.
• If backing at night, provide spotter with illuminated wands.

While backing:

• Use a spotter to assist.

• Don’t allow your spotter to walk backwards while giving instructions.

• Keep your spotter in your mirror and don’t let them stand in the path of your apparatus.

• Place your transmission in reverse and listen for the back-up alarm before taking your foot off the brake.

---

**WARNING**

Back up Hazard.
Ensure that personnel are clear before driving in reverse.
Always use a spotter when backing.
Failure to comply may injure or kill.

---

**PARKING SAFELY**

**Parking On a Grade**

Park on level ground whenever possible. Never park on a steep grade (a grade that is more than 20 percent). A 20 percent grade means that the ground rises one foot vertically for every 20 feet of horizontal distance. Your apparatus is not designed to park safely on any grade that is steeper than 20 percent.

When parking on any grade, set the parking brake and then remove your foot from the service brake pedal slowly. Observe the ground to make sure your apparatus is not moving. If your apparatus moves, relocate your apparatus to a more level location. Chock your wheels immediately upon exiting.

**Park Away From Fire**

When positioning your apparatus at a fire scene, be aware of where the fire is and where it is likely to spread. Park up-wind from the fire and in an area where the apparatus will be protected from direct heat and flames. High heat will melt lights, damage paint and, in extreme cases, catch the apparatus on fire.

Burning embers in the engine air filter can start the engine and vehicle on fire. Your apparatus is equipped with an ember screen to reduce the likelihood of burning embers catching the air cleaner media on fire, but it is not a guarantee. Determine where the air intake opening is located on your apparatus and avoid running the engine in an emberrich environment to minimize any possibility of catching the rig on fire.
SAFETY

Park Away From Fuel Vapors

Your apparatus is powered by a diesel engine. A diesel engine does not require a spark for ignition and will continue to run as long as there is fuel available. If you run your engine in an atmosphere that is laden with fuel vapors, such as at a fuel spill or gas leak, the engine may increase speed uncontrollably. If turning the ignition switch or battery switch OFF does not cause the engine to stop running it may be in a runaway situation. The only way to stop the engine in this situation is to eliminate the fuel source. Engage the emergency engine stop (if so equipped), eliminate the source of the fuel vapors, or cover the engine air intake to starve the engine of air and vapor.

Leaving Apparatus Unattended

Never leave your apparatus unattended. If your apparatus includes an aerial device, stow the aerial and retract the stabilizers. Park the apparatus in a secured location, and take other precautions as necessary to ensure that unauthorized personnel are prohibited from operating it.

Park Away From Power Lines

Look up and live. Always check the area and identify power lines before positioning your apparatus. Make sure you are well clear of power lines before raising equipment such as aerial devices or light masts. Never climb onto the apparatus if it will bring you closer than 20 feet from an overhead wire. Overhead power lines are not insulated. Some lines have a weather covering and appear to be insulated; they are not.

You or your apparatus do not need to touch a power line to be energized. Electricity arcs across ionized paths of air when a conductor is close enough. Consider all overhead wires or cables to be hazardous and dangerous. Never touch the outside of a vehicle you suspect may be energized while you are standing on the ground. Electricity will flow from the vehicle through you and into the ground. Move away from the vehicle and stay away. Warn others to stay away.

Unless the vehicle is on fire, it is safer to stay in the charged vehicle than to attempt to exit. If it is necessary to exit the vehicle, jump as far away as possible while landing with both feet together. Maintain your balance. Fall forward and away from, rather than backward and towards the vehicle. Once clear of the vehicle, don’t return until a power company representative confirms that it is safe and that the line has been de-energized and grounded. Do not attempt to rescue a person in or on a charged vehicle.

- Look up and live.
- Stay in or on a charged vehicle.
- Stay away from vehicles charged by power lines.
- Keep vehicle, people and equipment away from power lines.
Idle Mitigation

Your apparatus may be equipped with idle mitigation technology to improve fuel economy and reduce the carbon footprint of the apparatus. This system shuts the main chassis engine off and then starts it again when the idle mitigation batteries require recharging. When the engine starts, the fan, belts, and other components will spin. Keep hands, clothes and other body parts clear of all powertrain components. Never crawl or work beneath your apparatus or work near your apparatus powertrain unless the ignition switch and the battery switch are both in the OFF position. Use lock-out tag-out procedures before servicing or maintaining.

Winch and Rope Anchors

Your apparatus may be equipped with a hitch receiver or other device intended to anchor a portable winch or to be a tie-off point for rope operations. Pulling in a direction other than a straight line away from these anchors must be done with extreme caution. Your anchor is designed for maximum pull in a straight line away from the apparatus only. Align your apparatus with the pull or the capacity of the anchor will be significantly reduced and you risk an anchor failure.
FUEL SAFELY

Before fueling, turn off the engine. Put your apparatus in neutral, set the parking brake, turn off the ignition switch, and chock the wheels.

Use only ultra-low sulfur diesel fuel (15 ppm sulfur).

Disable or turn off any auxiliary sources of ignition such as on-board fuel operated line voltage generators or fuel-fired heaters.

Do not smoke, light matches or lighters while refueling.

Use only the refueling latch provided on the dispenser nozzle.

Stay at the nozzle until the tank is full.

Never blend gasoline, gasohol and/or alcohol with diesel fuel. This practice creates an extreme fire hazard and under certain conditions an explosive hazard.

Check and fill the DEF tank with DEF if required.

Never add DEF to the Diesel fuel tank, and never add Diesel fuel to the DEF tank. In either case severe engine and/or emissions system damage will occur.

BEFORE PLACING YOUR APPARATUS IN-SERVICE

No truck should be placed into service if there is any doubt or evidence of improper or inadequate function of any of the components or systems.

Install Electronic Equipment Properly

Do not add electrical devices to your apparatus unless they are installed by qualified service technicians who understand how to provide proper circuit protection. Always replace fuses or circuit breakers with the correct size. Improper fuse or circuit breaker sizing can cause wires to overheat and burn.

Do Not Install Equipment in Air Bag Path.

If your apparatus includes Inflatable Occupant Restraints, determine where each of the air bags is located, and where their deployment path will be. Never mount equipment in the path of an air bag. This includes the following areas.
• The outboard area between a seat and the side of the cab.
• Between the front passenger seat and the dash (officer knee area).
• Between the driver seat and the dash (driver knee area).
• Under any seat suspension.
• On the steering wheel.

Install Front Bumper Mounted Equipment Properly

Avoid mounting equipment in a manner that blocks airflow to the grill. Large items blocking air to the grill may degrade cooling performance and cause the engine to overheat during heavy use and high ambient temperatures.

When mounting equipment to the bumper deck plate of a tilt cab, consider the motion of the cab when tilting to avoid interference in the tilted condition.

When mounting equipment to the bumper deck plate, do not block headlights, warning lights or flashers, turn signals, and side markers. Blocking any of the above can put the apparatus and personnel in danger of a collision that may cause injury and/or death.

Install Cab Interior Equipment Properly

Consider the effect of cab tilt on equipment storage to avoid damage from items falling forward when the cab is tilted for service or maintenance.

Monitor the weight of items installed in a tilt cab, or stored in tilt cab storage areas. Too much weight inside the cab may prevent the cab from being tilted for service or maintenance.

Refer to NFPA guidelines when mounting equipment inside the cab to avoid unnecessary risk of injury from flying objects during a collision.

Use caution if drilling into cab walls and headliners to mount equipment, as there may be wiring, heater hoses, or air conditioning hoses hidden beneath the surface.

Never mount any equipment in the deployment path of an air bag, seat belt pretensioner, or suspension seat pull-down device.

Install Air Pressure Operated Equipment Properly

Any air-operated equipment must only be added to the air system downstream of a pressure protection valve.

Consider the airflow requirements of any air-operated accessory that will draw pressure from the vehicle system. The engine air compressor output is but a fraction of its total capacity at engine idle and will not keep up with the continuous operation of most shop type air tools.

Pressure protection valves are installed in both front and rear brake systems to ensure that no other air pressure requirements of the vehicle are allowed to deplete the vehicle braking system capabilities.

Addition of any air pressure equipment added by the end user up-stream of these pressure protection valves will negate the conformance of the vehicle to this NFPA recommendation and property damage, personal injury and/or death could result.
Consider Dissimilar Metals When Mounting Equipment

Consider the metal types whenever mounting accessories. Dissimilar metals placed in direct contact with each other and subjected to moisture will form a galvanic reaction that will lead to rapid corrosion and possible failure of the mount, fastener, or base material. Select mounting material and fasteners to avoid dissimilar metals, or coat all mounting surfaces, base material, and fasteners with a commercial grade-rust proofing agent such as those conforming to MIL-C-0083933A specification.

Load your Apparatus Properly

Before placing the apparatus in service, load all compartments with the intended equipment and manpower. Top off all fluid tanks and obtain front and rear axle weights from a certified scale. Compare the results to the axle capacities listed on the Federal Motor Vehicle Safety Standard (FMVSS) information decal located inside the cab. In service weights must not exceed the axle capacities listed on the tag. If the scale weights are higher than the gross axle weight rating (GAWR) values listed on the label, move or remove equipment and re-weigh the apparatus until you are within the axle’s limits.

Once you have each axle within its GAWR limits, obtain individual wheel weights and be sure you are within 7% weight difference from side to side.

Establish a routine of repeating the axle weight review at least annually to ensure that changes in equipment storage or other variables have not increase the axle loading beyond their placarded capacity.

Establish Correct Tire Pressure Values

Use the in-service axle weights to determine the correct tire pressure values using the latest information from your tire manufacturer (available on-line). Each tire manufacturer provides charts that will tell you the proper tire pressure for the load that the tire is carrying. Be sure to use the correct data based on your specific tire make, model, and size. Record the correct tire pressure settings on your vehicle inspection checklist. Adjust your tire pressure to match these values.

NOTE: The tire pressure indicated on the FMVSS label located in your apparatus cab will be based on loading your tires to the Gross Axle Weight Rating (GAWR). If your apparatus in-service axle weight is less than the GAWR, then you should decrease the tire pressure to the correct value based on your in-service load. Failing to do so will reduce handling performance and lead to a rougher ride.

Leaf Spring Suspensions With U-Bolts

Your apparatus may be equipped with a leaf spring suspension at the front, the rear, or both. Leaf springs can settle during the initial run-in process, dropping by as much as 0.50 inches. U-bolts must be tightened to their proper torque after the first 500 miles of apparatus driving, or 500 miles after a spring has been replaced.

Safety Equipment

Ensure that all of the safety equipment required by NFPA, your department policy, and applicable regulations are on the apparatus or available including:

- Personal Protective Ensembles.
- Fall Protection Belts, Tethers, or Harnesses.
SAFETY

• Wheel Chocks.
• Traffic Cones or Flares.
• Fire Extinguishers.
• Safety Vests.
• AEDs.

Demonstration and Training

Factory or dealer demonstration may be provided to familiarize you or a department with the apparatus. Training is the responsibility of the department and should include instruction, experience, and skills testing. All personnel that will operate the apparatus should have completed department authorized training in accordance with NFPA 1451 Standard for a Fire and Emergency Service Vehicle Operations Training Program.

PUMPER SAFETY

Storing, Deploying and Retrieving Hose Safely

Your apparatus may be equipped with hose storage areas. There are hazards related to stowing and laying hose and you must develop safe procedures for doing both.

Your department may choose to drive your apparatus during the hose laying or stowing procedure. This must be done with extreme caution and under the supervision of fire department authorities. Your apparatus is designed to transport personnel while seated and belted in the cab only. Any procedure that involves personnel riding on the apparatus, working around a moving apparatus or handling hose that is being dropped off a moving apparatus, involves risks that your apparatus was not designed to avoid. Understand these risks and develop your safety procedures accordingly. Your procedure should address the following risks:

Snags and Snarls

Hose storage areas may have structural features or components that can snag hose while it is being pulled out. Such features may include hose chutes, hose bed cover supports, emergency lighting, access steps, hand rails, pre-connect piping, etc. You will need to develop hose packing and deploying methods that will reduce the possibility of snags.

Pack hose carefully in any hose storage area to minimize the risk of hose or connections snagging or snarling during deployment. Hose that snags or snarls during deployment from a moving vehicle can whip violently, causing death or injury.

Slips and Falls

Develop hose practices that will protect yourself and others from slips and falls. This may include the use of auxiliary ladders, scaffolding, safety harnesses or other methods while stowing hose in areas that are high up on your apparatus.
Driving while Deploying

If you choose to drive your apparatus to deploy hose, never drive faster than you have determined to be safe, and definitely never faster than 5 mph (8 kph). Your apparatus is very heavy and powerful. It will not be stopped by a hose. If the end of the hose is held firmly to a hydrant or other object and the deploying hose catches on part of the apparatus, the hose in between will whip violently and forcefully causing damage, injury or death.

Do not stand on or near hose and hose couplings when vehicle is moving. Never wrap hose around you or others while deploying. Serious injury may result.

Driving while Retrieving

Do not reload hose by backing the vehicle up while personnel are walking behind the vehicle. This is an extremely hazardous practice. Drive forward over the top of the hose so that you can always see where you are driving. Stop after each section has passed the rear bumper, place the transmission in neutral, and apply the parking brake. Only when you are sure the vehicle is stopped and the parking brakes are set should you signal that it is safe for personnel to approach the apparatus and load the section of hose that is now behind the vehicle. When that section has been loaded, clear the area and drive forward over the next section. Repeat this process until all the hose has been loaded.

Consider other methods such as using hose rolling devices that make it easy to roll each section of hose and wheel it by hand to the parked apparatus. Whatever method you choose, always place the safety of your crew ahead of time or efficiency considerations.

Hose Bed Covers

Your apparatus may be equipped with solid hose bed covers. These covers are heavy and will be affected by strong winds and the grade the vehicle is parked on. The vehicle should be parked on level ground when the cover is lifted. Do not lift the cover in strong winds. Use two people to lift the cover. Make sure the cover restraining devices are in place and secured before releasing the hold of the cover. Make sure personnel have a secure hold of the cover when releasing the restraint device. Failure to follow these instructions could result in serious injury.
**USING HOSE SAFELY**

**Hose on the Fire Scene**

If your apparatus is equipped with a pump it can produce very high water pressure. Fire hose under pressure can burst without warning. Use only tested hose with your apparatus and never straddle or stand over a charged hose. Hose fittings can fail without warning. Inspect hose fittings for cracks, chips or other damage and replace when worn or damaged. An uncontrolled hose discharging foam or water will whip violently. Never pressurize a hose unless the discharge nozzle is closed and the nozzle is held or secured firmly.

**Testing Hose**

Your apparatus was never designed to be a hose testing device. While NFPA 1962 Standard for the Inspection, Care and Use of Fire Hose, Couplings and Nozzles and the Service Testing of Fire Hose does include a procedure for using a stationary pump or apparatus for hose testing, we recommend employing a proper hose testing machine as a much safer alternative. Hose test machines can develop the required test pressure at very low power levels. Since the whole point of hose testing is the assumption that your hose has seen service that might render it incapable of standing up to the test pressure, it is much more prudent to perform hose tests with the proper equipment. WE CANNOT BE RESPONSIBLE FOR INJURY IF YOU DECIDE TO USE YOUR APPARATUS TO TEST HOSE AS YOUR APPARATUS WAS NOT DESIGNED TO DO SO SAFELY.

**DISCHARGE WATER SAFELY**

Your water pump is a powerful machine which can hurl many tons of water every minute. This type of power can do great good in suppressing fire, but it can do great damage if not handled properly. Always treat pressurized hose and piping with the greatest respect and be thoroughly trained on safe pumping procedures before operating your pump. Be sure to avoid the following potential hazards:

**Water Stream**

You should use water streams for fire suppression only. Never direct your water stream at a person. Never open a discharge valve where the stream could strike a person. Water streams may knock people to the ground, causing injury or death.

**Power Lines and Fire Suppression**

Water is a conductor of electricity. Recognize the ability of water to conduct electricity. Never spray water around high voltage electrical wires. Electricity can travel down a water stream. Never spray water or foam through or onto live electric wires.

**Boiling Discharge Water**

It is essential that you always keep your pump water cool. This means that you must always circulate cool water through the pump. Your apparatus may include a recirculation valve that must be opened, or your apparatus may require the tank-to-pump valve be open and the tank-fill valve to be opened slightly. You must know how your pump works and the necessary steps to keep the water cool. A pump without a constant supply of cool water flowing through it can quickly overheat the water. Hot water and steam may cause severe burns if overheated water is discharged on you or another person.
Matching Equipment to Pump Pressure

Your apparatus was manufactured with fittings, valves and piping connections as specified by your department. You must be sure that fittings, valves, connections, hoses and nozzles that you use with your apparatus are compatible, tested and capable of the flow rates and pressures that you will be using them with. Hoses, valves and fittings can explode if pressure capacity is exceeded. Never exceed the working pressure of downstream devices.

Pump Operation

Your pumping apparatus will power the pump using either the main truck driveline, a power-take-off from the engine or transmission, or a separate dedicated engine. You must study and learn how to properly engage, disengage and operate the pump on your apparatus. As a custom apparatus, every pump control layout may be different as specified by your department. The operation of your pump was demonstrated by your apparatus dealer at the time of delivery to members of your department who are responsible for training you in proper operation. Also study the IFSTA Pumping and Aerial Apparatus Driver/Operator Handbook to learn critical information on proper pumping procedures.

Emergency Pump Procedures With Failed Engine Control

Your apparatus may control pump pressure with a manual engine control and a relief valve or with a pressure governor. In either case, you should learn what to do if your primary pump control fails. Many apparatus can continue to pump after a control system failure by stationing an operator in the driver’s seat and having them control engine speed with the foot accelerator. This procedure can be used in an emergency, but the firefighters on the lines should be immediately recalled from imminent danger, and the apparatus should be replaced on the fire scene as soon as possible. Take great care to keep a steady foot on the pedal to avoid sudden fluctuations in pressure.

Pressure Fluctuations

Sudden changes in water pressure are hazardous to firefighters at the end of a hose. Rapidly fluctuating pressure in a fire hose can cause the hose to whip. You must learn to avoid the many causes of pressure fluctuation including:

- Turning off a pressure governor.
- Sudden adjustments to engine speed.
- Opening or closing valves too quickly.
- Failing to remove air from pipes and hoses.

Always bleed the air from the intake lines before opening the intake valve at the apparatus. Stay alert for fluctuations in hose pressure and react quickly and safely when they do occur.

Intake and Discharge Caps

Your pumping apparatus may be equipped with either threaded or Storz-type couplings. In either case, you must avoid the hazard of removing intake or discharge caps that have pressure behind them. Intake and discharge caps can trap pressure if the valve controlling the connection is opened and then closed again when there is pressure in the system. This pressure can remain trapped between the cap and the valve for a long time. Always open the drain or bleeder valves first to relieve any pressure that may be trapped behind the cap before attempting to remove it. Open caps slowly and never stand in front of a cap.
during its removal. If you open a cap with pressure behind it, the cap may blow out at you with extreme force. You or others may be injured or killed.

**WARNING**

Pressure Hazard

ALWAYS OPEN Drain or Bleeder Valve to release pressure BEFORE removing Intake or Discharge Cap.

Caps can trap pressure.

Cap under pressure can fly off with great force.

Flying Cap will injure or kill.

Do not paint over this label. Replace if damaged or lost.

**Pump and Roll**

Your apparatus may be designed to Pump and Roll. This means that you can discharge water while the apparatus is moving. This may be beneficial for fighting grass or wildland fires. While the apparatus may have this capability, you must take particular care if you use this capability.

Remember that your apparatus is designed to transport personnel only if they are seated and belted. You should only discharge water from a moving apparatus by using a method approved by the National Fire Protection Association. If you choose to move the apparatus with firefighters using charged lines walking with the apparatus, use the following precautions:

- Drive at slow speeds only.
- Always stay clear of a backing vehicle.
- Never walk in front of a moving vehicle.
- Keep walking personnel alongside the apparatus and in view of the driver at all times.
- Keep walking personnel far enough from the apparatus so that they won’t be crushed if the apparatus were to roll onto its side.
- Develop and practice procedures to get walking firefighters quickly into the apparatus and belted into a seat in the event that the fire shifts, and you need to retreat from the area.

**High Pressure Two-Stage Pump**

Your apparatus may be equipped with a two-stage high pressure pump. A two stage pump can be operated in the VOLUME mode at typical municipal fire suppression pressures of 80 to 120 psi (550 to 690 kPa). In the PRESSURE mode, this same pump can discharge at pressures up to 600 psi (4140 kPa), useful for charging standpipes in high rise structures. Normal fire suppression hose, nozzles, wyes, and other appliances are not likely to be rated for these high pressures. Train your personnel to use only specially rated high pressure hose and components when operating in the PRESSURE mode.
Ultra-High Pressure Water Stream

Your apparatus may be equipped with Ultra High Pressure (UHP) streams of water or foam solution to fight fires. UHP presents unique hazards and should be used only by trained, safety-conscious personnel. UHP water or foam solution is discharged at pressures over 1,000 psi. At this pressure, the discharge stream may be capable of puncturing human skin, thus entering the blood stream. Personal protective equipment (PPE) such as gloves, turn-out gear, boots and a mask with a face shield should be worn whenever using UHP.

Tighten all fluid connections before operating this equipment and check the hoses, nozzles, and couplings after every use. A leak in a high pressure line can inject fluid into human skin just as it can from the nozzle. Never search for leaks with your hands or other body parts. Use a piece of wood or cardboard to detect leaks, keeping hands and other body parts well away from the potential source of the leak. Replace worn, damaged or loose parts immediately.

Ultra-High Pressure Piercing Equipment

Your apparatus may be equipped with an ultra-high pressure device used for piercing structural material. These devices use an aggregate added to the water stream that will cut through solid objects. It will also cut through skin and bones. Use safety precautions and treat a UHP piercing device with all the respect you would use with a firearm.

Foam Concentrate Types

If your apparatus is equipped with a foam system, you should know and understand the type of foam solution that it’s capable of using. Never mix brands or types of foam concentrate, or the foam produced may not be adequate for the fire suppression capability desired.
Water Monitor

Your apparatus may include a water monitor on the front bumper, cab roof, apparatus top, or other location. You may also choose to use a ground monitor when pumping. Following these practices when discharging water from a monitor:

- Charge your monitor slowly. Rapid charging may cause a pressure surge which has the potential to cause an injury, or damage the monitor.
- Aim your monitor in a safe direction before discharging water.
- Never direct the stream at power lines or people.
- If there is a nozzle attached, ensure that it is tight and not over tightened before using the monitor. Do not use with a loose nozzle. A loose nozzle is a dangerous projectile. Ensure the thread on the nozzle swivel matches the thread on the monitor outlet. Do not over tighten the nozzle onto the unit.
- Read and follow the warning tag instructions on the lock pin lanyard.
- Do not exceed the maximum pressure or flow ratings of the monitor. Exceeding these ratings may lead to an injury or may cause damage to the monitor.
- If not equipped with the automatic drain valve, drain the monitor after use to prevent freeze damage.

Ground Water Monitor

In addition to the above instructions, a ground monitor (water monitor not attached to your apparatus), must be properly secure staked down or otherwise secured before use. Water discharge force will cause a loose monitor to fly about with great force causing injury or death.

AERIAL SAFETY

Your aerial device is a very complex machine that requires specific knowledge, training and experience to operate safely. You must study and learn how to properly set up and operate your aerial device. Study this manual and the IFSTA Pumping and Aerial Apparatus Driver/Operator Handbook to learn the proper procedures.

Emergency Stop Feature

Your aerial device will have an emergency stop (E-Stop) feature at the primary operator station controls. This may be a switch on the panel, or an operator presence foot pedal. This is a very important safety feature on the aerial. If something goes wrong and the aerial is behaving in a manner you don’t understand, use the emergency stop feature to stop all aerial functions.
Once aerial functions have ceased, clear personnel from the area and determine what is wrong before resetting the emergency stop feature and continuing operation. Practice using the emergency stop feature during training sessions until it becomes second nature so that your mind will react quickly in an emergency.

**Emergency Power Unit**

Your aerial device uses power supplied by a hydraulic pump that is driven by a power take-off from the engine. It is always possible that a mechanical, electrical or hydraulic failure can occur that will interfere with the operation of your aerial device. The Emergency Power Unit (EPU) will provide back-up power and, in most cases, allow you to continue operation until you can recall personnel from harm’s way, stow the device and remove it from the fire scene for repair. Do not rely on the EPU for extended use as it is not designed for continuous operation.

**Over-Ride Controls**

Your aerial device is certain over-ride features that will allow “out of the ordinary” operation in certain cases of equipment malfunction. You should learn where these controls are located and how to operate them. Practice using your override controls until you are just as proficient with them as you are with the standard controls.

If the normal control system does malfunction, recall personnel from harm’s way immediately and take the device out of service until it can be repaired. Use emergency override controls with extreme caution and only when all non-essential personnel are well clear of any hazard.

**Interlocks**

Your aerial apparatus will be equipped with a number of interlock functions, many of which are required by NFPA 1901 Standard for Automotive Fire Apparatus. Interlock devices are intended to reduce the possibility of unsafe actions, but they should never take the place of careful, thoughtful and prudent operation. Interlocks rely on the proper functioning of sensors, wiring, relays and computers. These are physical components that have finite lives and can fail from a number of causes such as wear, corrosion, accidental damage or aging. You should identify each interlock and develop a procedure on how to safely ensure that each is functioning.

Aerial device interlocks may include:

- **Stabilizers Set**: The aerial device will not operate unless the stabilizers are deployed.
- **Nozzle Stow**: Device will not drop into the cradle if the master stream nozzle is not properly positioned.
- **Body Collision**: The device will not move into regions where it would make contact with the body or cab.
- **Maximum Elevation Slow-Down**: The device will slow down prior to reaching maximum elevation or extension.
- **Rotation Interlock (Short-Jack)**: The aerial device will not rotate over the side of the apparatus where the stabilizers are not fully extended.
- **Tiller Operator Interlock**: Engine starter will not work unless the tiller operator is seated and belted, or a tiller cab start button is engaged.
• **Aerial Function Interlocks**: The aerial device will not operate until the parking brakes have been set, and the transmission has been placed in neutral, or the transmission is in the drive position and the system in pumping mode.

**PREPARE FOR SAFE AERIAL OPERATION**

**Select a Site**

Selecting the right spot to position your aerial apparatus is critical. You must anticipate fire ground needs and identify areas where to position so that the aerial tip can reach your intended targets. Select a position that will support your apparatus weight and meet all of the following criteria:

- Clear of areas exposed to falling debris.
- Clear of overhead power lines.
- Flat enough to allow leveling within the green or yellow zone.
- Firm and stable surface. Avoid loose objects, underground utility access covers, broken pavement and areas that drop off suddenly.
- Never position on a railroad track or an active airport runway.

![Aerial Stability Hazard](image1)

![Crush Hazard](image2)
Set-Up

Once you have selected a set-up location, clear the area of personnel and use spotters to maneuver your apparatus into position. Follow the instructions in this manual to place your apparatus in operation ensuring the following:

- Use stabilizer pads (if equipped).
- Keep the stabilizers in your sight at all times while deploying.

Setting Up Within Safe Limits

Your aerial device must be within a few degrees of being level for safe operation. Check your level indicators to make sure that the device is properly leveled. The correct angle reading is where the center of the ball lines up with the gradation lines marked on the tube.

![Figure 2-1. Level indication of 6 degrees](image)

Correct Reading of this example indication is 6 degrees.

You can still operate safely even if your device is not perfectly level, but only if you keep it within the safe limits as indicated on the load chart for either the green or yellow zone. Do not operate with either the front-to-back or side-to-side level indicators in the red zone.

</tr>
</tbody>
</table>

Avoid operating your ladder in a condition where the ladder rungs are not level to the earth as this will make climbing more difficult.
**Short-Jacking**

Your apparatus may allow for partial extension of the stabilizer arms (short-jacking). This capability allows your apparatus to be set up in an area where obstructions or surface condition do not allow them to be extended completely on one side.

Set up the apparatus so that the stabilizers can be completely extended in the direction that you will be working and extend them as far as possible on the opposite side. In this condition you will not be able to safely rotate the device over the side where the stabilizers are not fully extended. Whenever possible, a safety officer should observe aerial operations when you are using short-jack procedures.

*Figure 2-2. Short Set Rotation Interlock Stop Points*
OPERATING YOUR AERIAL SAFELY

Primary Control Operator

Operation of your aerial requires a qualified operator to be stationed at the primary controls on the turntable of the device at all times. You must also have a qualified operator at the controls any time there are personnel on the device, even if the device is not moving. The primary operator must be thoroughly trained, experienced and authorized by your department to perform primary control operation. A primary operator at the turntable controls is responsible for the safety of the operation, and is there to make immediate changes as needed to avoid imminent or changing hazards such as:

- Heat.
- Flames.
- Wind speed.
- Icing conditions.
- Wind and smoke direction.
- Power lines.
- Structural obstacles.

WARNING

Do not paint over this label. Replace if damaged or lost.

Operator Attention Required

Trained operator must remain at primary controls any time there are personnel on the device.

Do not operate this device using platform or tip controls without a trained operator at the primary controls at all times.

Be alert for changing conditions and be prepared to remove device personnel from danger.

Failure to comply may injure or kill.

Secondary Control Operator

Your apparatus may have secondary controls at the tip of the ladder or at the platform bucket. These controls are only meant to be used with an authorized operator still at the primary controls. The primary operator must be prepared to override the tip or platform bucket operator if unsafe conditions are encountered. Both operators should be in communication with each other and with other personnel on the device at all times. If your apparatus is not equipped with a platform, keep the aerial ladder extended and use the fold-down steps with toe-guards and keep your fall protection tether secured to the device.

Use of a Spotter

During operation you may find that you are not able to see clearly through smoke or fog, or due to obstructions located on the far side of the device from where the controls are positioned. In situations such as these, you must use a spotter. Agree upon and train using standard verbal commands and visual signals until the team can perform operations safely and efficiently. If multiple spotters are required to ensure that all blind spots are covered, practice methods of ensuring that only one spotter at a time is giving directions.
Avoid Overhead Power Lines

Power lines are everywhere, and they present an extreme hazard to you and your aerial device. Unlike utility bucket trucks, your device is not insulated and will conduct electricity. Electrical arcs will burn, maim and kill you and others on or around the device if you get too close to them.

- Look up and Live. Always watch for power lines overhead.
- If operating at night, use powerful lights to search for power lines or poles.
- Stay 20 feet from power lines less than 350,000 volts.
- Stay 50 feet from lines over 350,000 volts or if the voltage is not known.
- Account for the swaying or bouncing motion of both the power lines and the device.

Extra Precautions Around Power Lines

If your apparatus is being operated around power lines you must take extra precautions. If the apparatus contacts a power line it will be electrified and the current will seek a path to the ground. If you are standing on the ground and touching the apparatus at the same time, you will be electrocuted. It is safer for you to be either completely on the apparatus, or completely off it and not touching it. If your apparatus includes a pump it will have a pump operator platform. Always stand on this platform while operating the pump so that you will be safer if your apparatus becomes electrified.

If Your Device Becomes Electrified

If you are on or inside a vehicle that becomes energized by a power line, stay where you are. Exiting the vehicle is more hazardous than remaining on it. Stay in or on the vehicle until a power company representative informs you that the line has been de-energized, grounded, and that the area is safe.

If it is critical that you leave the vehicle, JUMP as far away as possible, landing with both feet together. Maintain balance or fall forward; don’t fall back towards the vehicle which could result in your body becoming a pathway between the vehicle and the ground. No part of your body should touch the vehicle and the ground at the same time.

If you are outside of the vehicle that contacts or is energized by a power line, move away from the vehicle, and stay away. Warn others to stay away.
Rungs Aligned

Before allowing personnel to climb a telescoping aerial ladder or the ladder section of an elevating platform, you must ensure that the rungs are aligned. This will allow personnel to maintain proper foot angle while climbing and avoid the possibility of their feet getting caught between misaligned adjacent rungs. Your controls will indicate when the rungs are properly aligned for climbing. Always observe your ladder rungs directly to ensure that they are aligned.

Fall Protection

Any time you are climbing your device or operating from the platform bucket you must be wearing a ladder belt and tether or other approved fall protection PPE. The belt or PPE should be properly sized to fit you, and the length of the tether should be selected by the fire department safety officer based on your department’s procedures.

If you are operating from inside the platform bucket, tie off to a fall protection anchor indicated by this symbol:

![Fall Protection Anchor Symbol]

If you are on the ladder, tie off to a structural feature of the ladder such as a rung that will not allow the tether hook to slide downward. Do not tie off to non-structural features such as wires, cables, lights, brackets, etc…

You must be tethered to a structural feature of the ladder or platform bucket any time:

• The device is in motion.
• You are not actively entering or exiting the platform bucket.
• You are not actively climbing or descending the ladder (If you stop at any point during your climb, connect your fall protection to a ladder rung).

![Fall Restraint Required]

Fall Restraint Required
All personnel on aerial ladder or platform must wear safety harness with restraint belt properly attached to the device
Fall will injure or kill.
Climbing the Aerial Ladder

The National Institute of Occupational Safety and Health has considered the aspects around determining the optimum ladder elevation for climbing. NIOSH points out that there are several variables that must be considered when positioning an aerial ladder. One of these variables is the angle of elevation that is best for climbing. Steep angles of climb, even when kept within accepted standards, can make climbing and tool carrying more difficult for some persons.

Choosing an optimal climbing angle may require more than simply implementing a 1:4 or 75 degree angle “rule”. This rule has been derived from OSHA standards that may not account for to the heights firefighters may climb nor the bulk, weight and positioning relative to the body of the tools that they carry. Firefighters’ tools, PPE and SCBA place burdens on the body that should be considered. Adjust your angle of climb accordingly to minimize stress on climbers and allow them to maintain balance during the climb.

Use three points of contact and grasping the rungs as you climb. Grasping the rungs has several safety advantages over holding onto the rails:

• Your hands have more holding power when they are grasping a round bar than when they are grasping a rectangular object.

• If your feet slip and you are holding onto the rails, your hands may slide down the rails, and you may fall. If you are holding on to the rungs, it is more likely that your hands will have enough grip force to help you recover.

• If your feet slip and you are holding onto only one rail at the time, the weight of your body will be offset from your line of grip and your body will twist. If you are holding onto the rung, your grip force is lined up with your body, and your chance of staying in control is much greater.

There are four times as many falls from descending as from ascending a ladder. Pay close attention to your footing on the way down.

Water Towers

Your apparatus may be equipped with a water tower boom that is not equipped with a ladder and not designed to carry people. Keep personnel off the apparatus during any boom operation. The boom is designed for fire suppression only and is not designed nor equipped for carrying people. Do not climb or ride on this equipment, and do not allow others to do so.

• Do not climb or ride on boom.

• Do not lift people.

• Do not lift objects.

Boom Style Platform

Your apparatus may be equipped with a boom-style platform bucket that is not equipped with a ladder and not designed to carry people. Keep personnel off the boom during operation. The boom is designed for supporting the platform bucket only and is not designed nor equipped for carrying people. Do not climb or ride on the boom, and do not allow others to do so.

• Do not climb or ride on boom.

• Do not lift people.
• Do not lift objects.

**Wire Rope Hazard**

Your aerial device uses wire rope (cables) to extend and retract the ladder. Anywhere wire rope comes close to or contacts other mechanical parts such as pulleys, sheaves, roller guides or structural features on the device, a pinch hazard may exist. Anyone operating, climbing on, or supervising others on an aerial device that uses wire rope should study the wire ropes and follow these safe practices:

• Stay clear of wire rope, pulleys, and sheaves during operation.

• Never touch wire rope while someone else is at the control or during operation.

• Never touch wire rope while in tension or under load.

---

**Operating With Personnel on the Aerial Ladder**

You must never allow personnel to climb, ride or work on your aerial device unless they are thoroughly trained in safe operation and the importance of using the three points of contact method of climbing. Make sure that when people are climbing while carrying equipment that they have such equipment in their pockets or tethered to themselves in a way that allows them full use of both feet and both hands.

Before allowing climbers ensure that the ladder will not move. Do this using one of the following methods (depending on device design):

• Stand away from the controls.

• Lock the system using the system lock.

• Remove your foot from the operator presence foot switch.

• Depress the Emergency Stop button.

Never extend or retract the ladder with people on the ladder unless they are at the secondary operator station at the ladder tip and their feet are securely on the supplied folding step(s). Never retract the ladder past where the section overlaps the secondary operator position. Extending or retracting the ladder with climbers on the ladder will crush their hands or feet.

Never rotate, raise, or lower the device unless personnel are secured to a structural feature with a ladder belt and tether.
Ladder Base Pinch and Crush

Your aerial device is made from heavy structural parts that are constantly moving past each other during operation. This creates dangerous pinch or crush hazards all around you. You must study your device carefully and keep yourself and others well clear of these areas during operation. Never allow people to hold onto or lean against the device while they are waiting for you to position it.

Operating with Personnel Near the Aerial

There may be times during operation when other personnel are working in the same vicinity. Instruct and train your department personnel that they should approach a working aerial device apparatus only after getting the all-clear from the primary control operator. Keep personnel clear of swinging structures and other moving parts. Keep them away from the area beneath the device and from around the apparatus. Items accidentally dropped by personnel on the device may injure or kill those below. Falling items may bounce off the ladder, turntable or other parts of the apparatus and strike personnel at some distance from the apparatus. Take extra precautions during icing conditions to keep personnel from being injured by ice falling from the device.

Operating Within Safe Limits

Your aerial device will have a load chart that is specific to your device make and model and will be located near the primary operator station. You must study and memorize your load chart so that you will not need to refer to it constantly during operation. The load chart criteria should be so familiar that you can instantly recognize when the device is nearing a critical or overload condition.
Your load chart will tell you how many people you can have in various locations on the device depending on the elevation of the device, whether you are flowing water or not, and whether you are leveled within the green or yellow zones. Your device can support more people as the angle of elevation increases.

The safety of your operation also depends on factors that cannot be measured precisely and may change rapidly including:

- Level condition (Green or Yellow).
- Monitor water flow and direction.
- Wind speed.
- Wind gusts.
- Ice build-up.

You must be familiar with conditions that will reduce the capacity of your device and stay alert to changes in these situations.

You should always operate the device slowly, carefully and cautiously. Keep in mind that the load ratings on the chart are static ratings. This means that they assume only the weight of the personnel or equipment is acting on the device without bouncing or other sudden changes. Dynamic loading may be much higher than a static load. Do not allow personnel to bounce, swing or jump onto the device.

**Load Chart Limits and People on the Ladder**

Your load chart will indicate the maximum number of people that can be placed on each section of your ladder depending on the position of the device. Never exceed these limits.

Over 250 Counts for Two - the load chart is valid only if each person does not weigh more than 250 lb. (113 kg) including clothing, gear, etc. If you have a person on your device who is significantly heavier than this value you must adjust accordingly. For persons who are heavier than 250 lbs, count them as if they were two people.

FAMA studies have shown that the average firefighter with PPE and SCBA weighs 250 lbs. NIOSH studies suggest this value may be even higher. Take the time to weigh your personnel in PPE, SCBA, and the equipment they will have while climbing so you know when to adjust for heavier personnel.

One Person One Rung - the load chart assumes that people on a ladder are never sharing a rung. Keep your climbers spread out appropriately.
**Approaching Structures**

Your aerial device is designed to handle loads in the downward direction only. It will be damaged if it is loaded by resting the tip on a structure, powering it down onto a structure, powering it into the ground, or by using it to span a structure like a bridge. It may also be damaged if it is rotated into a structure. Never use it as a battering ram to knock over structures, break windows, or for any purpose other than fire suppression or rescue operations.

Never push or pull sideways on your aerial device. Do not use it as a crane.

During rescue operations, always aim the tip of your device above the victim and the structure and slowly lower toward the target. Stop the device six to 12 inches above the target. Personnel weight on the device will then cause the device to settle onto or just above the structure without risking a reverse-loading condition.

**Operating Above Structures**

There are times when you may wish to extend your aerial device over the top of a structure. Do not do this if there is a risk of a flashover or sudden roof ventilation. You should never position the device over high heat or open flame as exposure to high temperatures will weaken structural members, melt wires and hoses, and present a hazard to personnel on the device.

**Icing Conditions**

If you are operating your aerial device in freezing temperatures, you must be alert to the possibility of ice forming on the device. This can happen from freezing fire streams, freezing rain, freezing fog, or snow that melts and then re-freezes. You must use extreme caution when retracting or extending an aerial device that is coated with ice, both for the safety of personnel and to protect the device from damage. Keep personnel clear of the path of falling ice. Move the device slowly to allow ice to fall away.

Inspect the device thoroughly after operation in an icing condition as the operation with an ice coating can damage many components of the device and render it unsafe for future use.

**Windy Conditions**

High winds can tip over any aerial device. See your load chart to determine what wind speed your device is rated for. You must then select a method that you will use to determine the wind speed while you are operating. The best method is a wind speed indicator mounted at the tip of the device. You can estimate wind speed in an emergency using the Beaufort Scale if your wind speed indicator quits working or is unavailable.

</tbody>
</table>

Wind speeds usually increase the higher up you climb, and the wind speed at the tip of the device will have the greatest over-turning impact. Retract and stow your device before the wind conditions increase above the wind speed rating.

Just because your device is rated for a certain wind speed does not mean it is safe for people to be operating on the ladder or in the platform. High or gusting winds will be a hazard to climbers and people in a platform bucket. Consider removing people from the device in high winds and using the device for water delivery only.

**Flying Flags**

Your department may wish to use your aerial apparatus for tasks it was not designed for. Any use other than fire suppression or emergency rescue is not recommended. Flying flags, for instance, is a popular practice, but the forces imposed on your device are unpredictable and may exceed the load chart ratings. The risk increases as the wind speed and variability increases. Your safety officer should study any such practice carefully and take responsibility for the safety of the apparatus and for personnel in the area. Never exceed the load chart ratings.

**Lightning Threat**

Your apparatus will not protect you from lightning strikes. To avoid the risk of death or injury, retract your device and seek shelter before lightning storms enter your area.

**Rope Rescue**

Your aerial device may be equipped with a feature to facilitate rope rescue operations. The top portion of this feature may be an anchor point on your platform bucket, or a pulley device that attaches to the tip of your ladder. The bottom portion of this feature may be a fixed tie-off appropriately labeled near the base of the ladder, or a Change of Direction Bar that attaches to the ladder near the base of the ladder. Only use these provided features and/or devices to perform rope rescue with your apparatus.
Your apparatus is not a crane, and it is not designed to be used as such. Refer to your apparatus load chart. The weight that you lift should never exceed the load chart ratings, and it should never exceed the rated capacity indicated on the rope rescue anchors or change of direction bar. Anchor points or devices provided with your apparatus are intended to be used as a single anchor for a single rescue rope only.

To ensure that the capacity is not exceeded, it is essential that you lift in a smooth manner, without causing the device or the load to bounce, jerk or sway. Use appropriate methods to stabilize the load while it is being lifted.

If you are using the pulley provided for rope rescue, or if you have attached a single pulley to the anchor on your platform bucket, the working end of the rope must follow along parallel with the ladder to the turntable anchor, or be passed through the Change of Direction Bar pulley properly attached at the turntable. In this configuration, the rope will be raised when the device sections are extended and lowered when the device sections are retracted. Never use additional pulleys or block and tackle as the load on the device will be multiplied.

The working end of the rope should never be anchored to other parts of the ladder, other parts of the apparatus, static structures, or to objects on the ground. If the rope is anchored to a point that is not in-line with the ladder, the load on the device will be doubled and you will exceed the ratings and overload your aerial device. Overloading will risk device damage, tipping or collapse leading to injury or death.
Proper rigging for rope rescue, attachment of ropes to rescue baskets, and all other operations involved in rope rescue other than those outlined in this manual are the responsibility of you and your department. Guidelines that you may find useful when determining how to safely perform rope rescue operations with your apparatus include:

**Positionable Waterway Monitor**

Your device may be equipped with a pre-piped waterway that allows the monitor to be positioned at the tip for fire suppression, or on a lower section for rescue. If your device includes this feature it is essential that you always be sure that the monitor is secured in its anchor. If water pressure is applied when the monitor is not securely anchored, the pressure will cause the waterway to extend rapidly on its own. The rapid movement of the pipe sections can damage equipment or harm people who may be on the ladder at the time. Study the waterway on your device, understand the monitor anchoring mechanism, and always be sure the monitor is secured prior to charging the waterway.

**Aerial Ladder Pipe Operation**

Your department may choose to use a ladder pipe nozzle supplied by a fire hose that you lay along the ladder rungs. Only use this method with extreme care and under the supervision of trained personnel who understand the extra loads created by the weight of the hose and the reaction forces of the nozzle. Use only ladder pipes designed for the application and follow all ladder pipe manufacturer operator instructions and fire industry best practices.

Lay the hose along the middle of the ladder so that it rests on the rungs only. Tie off the hose so that it stays in the middle of the ladder when charged. Never hang the hose off the side of the ladder. Never use more than one ladder pipe nozzle and hose on your aerial ladder. Do not use an aerial ladder pipe and fire hose on an apparatus that is equipped with a pre-piped waterway and water monitor.

**TRACTOR DRAWN AERIAL OPERATIONS**

**Tiller Steering Lock**

If your apparatus is a tractor-drawn aerial there are two ways in which the trailer can be towed, with the rear steering functional or with it locked. Always check the steering lock before placing the vehicle in motion unless you have a tiller operator at the wheel. Driving without a tiller operator while the steering is unlocked will cause the trailer to steer uncontrollably.

Never attempt to lock or unlock the steering with the apparatus in motion.

**Tiller Steering**

If you choose to operate your aerial tiller with the rear steering unlocked, you must have a tiller cab operator seated and belted prior to placing the apparatus in motion. The tiller operator must be alert at all times to keep the trailer tracking behind the tractor, or to avoid traffic and other road hazards.
Tractor Operator Training

Obtain a Class-A Commercial Driver’s License or the equivalent fire department training and authorization prior to driving from the tractor position. This training must include the special aspects of driving a heavy combination vehicle.

Tiller Operator Training

The tiller operator must be trained, experienced, and authorized to occupy this role. Training should be conducted under supervision and in a controlled location.

Fifth Wheel Lock

Your tiller aerial apparatus may include a feature to lock the tiller trailer turntable connection (fifth wheel) from articulating up and down. It does not lock the connection from rotating. This locking feature is critical to providing stability while the ladder is being operated. This lock allows the weight of the tractor to contribute to stability. If you attempt to operate the ladder without the fifth wheel locked, the ladder could tip over.

The fifth wheel must be unlocked before moving your apparatus. Driving your apparatus with the fifth wheel locked would cause uneven loading on the axles. This could lead to serious driving hazards including reduced steering control, reduced braking control, and poor handling. Never place your apparatus in motion unless the fifth wheel is unlocked.

PERFORM MAINTENANCE SAFELY

Maintenance Records

The safety of your apparatus will depend on how well it is maintained, and good maintenance depends on keeping accurate maintenance and repair records. Maintenance and repair records should be maintained as permanent records and kept in a secure location. Acceptable records include itemized bills, dealer work orders, owner’s vehicle log, and service facility receipts, stating the date service was performed.

Vehicle Identification Number (VIN), mileage (kilometers), engine hours, and service performed. Consult NFPA® 1911: Standard for the Inspection, Maintenance, Testing, and Retirement of In-Service Automotive Fire Apparatus for apparatus inspection and maintenance recommendations.

Use OEM Parts for Repair

- Your apparatus is designed to operate as a system. Every part has been selected to ensure proper performance. While some common service parts such as fluids and filters may be available from heavy truck supply sources, purchasing repair parts from any place other than your authorized dealership may put the safety or performance of your apparatus at risk. All safety-critical components should always be sourced through your authorized dealer including:

  - Chassis structural components.
  - Chassis steering, suspension, and brake components.
  - Apparatus related electronics.
  - Aerial and stabilizer hydraulic cylinders including valves and manifolds.
  - Hydraulic rod-end pins, hardware, and locking devices.
SAFETY

- Ladder or boom slide pads.
- Aerial extension cables, sheaves, and anchors.
- Turntable rotation bearings, rotation gears, drive gears, and motors.
- Rotation sensing components (proximity switches, encoders, limit switches, etc...).
- Extend or retract sensing components (proximity switches, limit switches, etc...).
- Stabilizer extension sensing components (proximity switches, limit switches, etc...).
- Jack plant sensing components (proximity switches, limit switches, etc...).
- Wire harnesses and connectors.
- Wire bulkhead connector or other pass-through component for wires entering rung rails or hand rails.
- Corrosion inhibitor material for the interior of aerial ladder structural tubes.
- Mounts for securing equipment on the device (pike poles, roof ladders, etc...).
- Safety signs, load charts, and other instructional material.
- Hydraulic tubes, hose assemblies, fittings etc...
- Hydraulic valves, velocity fuses, filters, manifolds, solenoids, etc...
- Rotation swivel and associated components.
- Waterway including mounting brackets and seals.
- Cable tracks, raceways, and associated components used to guide cables and hoses (igus or similar).
- Rung covers.
- Aerial control valves, switches, levers and joysticks.
- Aerial motion control computing devices (plc or similar).
- Aerial remote control receivers, transmitters, controls pads, tethers, and associated equipment.
- Optional equipment such stokes basket mounts, rope rescue pulleys and anchors parapet ladders, etc...
- Fall protection anchors.
- Platform basket components including doors, gates, latches, handrails, etc...
- Stepping, standing, and walking surfaces.
- Access ladders and handrails.

Running the Engine

Unless a maintenance routine specifically states otherwise, turn off the engine and all other equipment prior to performing maintenance tasks.
Preparing for Maintenance

Remove all jewelry prior to working on your apparatus. Metal jewelry is a conductor and can cause burns if in contact with electrical power, and other injuries if worn while performing maintenance. Rings can get caught on projections leading to loss of fingers. Hanging jewelry can get caught in moving machinery.

Always use appropriate PPE including gloves, eye protection, hearing protection, safety shoes, and protective headwear when working on your apparatus.

Depressurize air, hydraulic and cooling system lines prior to removing or replacing components.

Ensure working areas are free from oil, grease, and foreign materials.

Compressed Air for Cleaning - DO NOT USE

The use of compressed air for cleaning is not recommended. Using compressed air for removing debris creates an environment of propelled foreign particles, which can cause injury to personnel.

Chemicals and Cleaners

Use only non-flammable solvents for cleaning component parts.

Keep chemicals and cleaners in approved safety containers and in minimum quantities.

Use approved protective equipment and clothing, such as gloves, apron, and eye protection, when handling chemicals and cleaners. Some chemicals have an adverse effect on skin and eyes.

Ensure adequate ventilation when using chemicals and cleaners. Some chemicals have an adverse effect on the respiratory tract.

Observe all manufacturers manuals, warning labels and current safety directives.

Use chemicals and cleaners in authorized areas only.

Dispose of all soiled clothes and materials in accordance with national and local directives for hazardous waste.

Decontamination Chemicals

Decontamination chemicals that contain hydrogen peroxide (such as Decon7) should be used with caution and strictly following the manufacturer’s instructions. Hydrogen peroxide is an oxidizing agent that will cause corrosion when applied to bare metal. It will also damage exposed electronics.

Follow these guidelines:

- Apply in the cab interior as a fine fogging mist only. Do not spray directly on bare or unfinished metal surfaces, or painted surfaces that have been scratched or marred.
- Do not spray or foam on switches, gauges, display screens, or other electrical or electronic devices.
- Remove accidental over-spray using water and a clean cloth.

Always follow the manufacturer’s safety recommendations while working with decontamination chemicals including:

- Use only EPA registered products.
SAFETY

- Avoid breathing mist or vapors.
- Wear Gloves (resistant to chemical products [butyl rubber, nitrile and neoprene, polyethylene, polyvinyl chloride]).
- Wear protective clothing.
- Wear eye protection (face shield or safety glasses).
- Wear Respiratory protective equipment (air respirator or SCBA).

**Tilting the Cab**

Always ensure that the vehicle is on a flat and level surface before tilting the cab. Tilting the cab on an inclined or non-flat surface may produce interference between components as the cab is lowered.

Before tilting cab:

- Check the front bumper and bumper extension to ensure that covers are shut and plumbing swivels are rotated forward. Remove all loose items from the cab as contents may shift or drop.
- Close the crosslay cover and stow any other body related feature that hangs over the cab.
- Raise any aerial device if located over the top of the cab.
- Ensure that there is clearance above the cab and the area is clear of power lines.

Always check to make sure that people working on or around the cab are clear before raising or lowering the cab. Immediately after raising ensure that the stay-arm or mechanical support is secured in the support position. Hydraulic cylinders can leak or drift and should not be relied upon to support the cab on their own.

If the cab fails to lower after following the proper instructions, do not attempt to force it. Have the system checked by a qualified technician and refer to the cab tilt system instructions in the service manual.

**Lock-Out Tag-Out**

You may come across an apparatus in your facility with a sign that says Lock-Out Tag- Out (LOTO) on it, or you may need to perform work where LOTO procedures are required. LOTO is the procedure used for preventing the unexpected release of hazardous energy while servicing and maintenance activities are performed.
Never operate a vehicle or equipment that is marked with LOTO devices. Always use LOTO procedures as required; failing to do so may expose you to hazards associated with hazardous energy sources. Follow your department procedures, which should conform to OSHA 1910.147 regulations.

**Access Features Not Provided**

Your apparatus may have methods to access equipment or machinery for service or periodic maintenance. These areas may or may not be equipped with a means of access that allows three points of contact at all times. If it is necessary to climb onto, into or around portions of your apparatus that are not equipped for three points of contact, special accommodations must be made for safe access in a controlled, service environment. Use overhead safety harnesses and tethers, step ladders, access platforms, scaffolding or other means to ensure that service and maintenance personnel are protected from stepping, standing and climbing hazards.

**Confined Space**

Your apparatus may contain spaces such as water tanks that are considered to be “confined” because their configuration hinders the activities of employees who must enter into, work in or exit from them. In certain instances, employees who work in confined spaces also face an increased risk of exposure to serious physical injury from hazards such as entrapment, engulfment and hazardous atmospheric conditions. Confinement itself may pose entrapment hazards, and work in confined spaces may keep employees closer to hazards such as machinery components. Limited access and restricted airflow can result in hazardous conditions that would not normally arise in an open workplace.

OSHA’s standard for confined spaces (29 CFR 1910.146) contains the requirements for practices and procedures to protect employees, in general industries, from the hazards of entering confined spaces. Evaluate your apparatus to determine if there are confined space hazards and take proper precautions before working in a confined space. Use lock-out /tag-out procedures where appropriate.

**Welding**

Your chassis has a high-strength steel frame rails that should not be welded on unless you are following a specific factory authorized repair procedure. Welding on your chassis frame in any manner not prescribed by the factory may result in serious structure failure.

Your apparatus includes electronic components that can be damaged from the high voltage and current generated during the welding process leading to apparatus failure.

Disconnect electronic devices prior to welding on your apparatus including:

- Bosch or WABCO ABS ECU.
- Cummins Engine ECU.
- Allison Transmission Control Module (TCM).
- Foam Pro foam system ECU, pump, and gauge connections.
- Flasher modules.
- Side Roll and Frontal.
- Occupant Protection system ECUs.
- Multiplex system modules.
SAFETY

Do not weld on galvanized frame rails or other galvanized components as serious adverse health reactions may result.

Interlocks

Your apparatus may include protective interlocks that modify or prevent certain functions. These interlocks were designed into your vehicle for your safety and the safety of your operators. Never place an apparatus back in service unless all factory interlocks have been restored to their proper function. Never bypass a safety interlock device.

Batteries

Always wear safety goggles and protective clothing when working on or around batteries. Do not check battery condition by shorting across terminals. Inhaling hydrogen gas produced by the normal operation of the battery could result in partial or permanent damage to the respiratory system. Battery posts, terminals and related accessories contain lead and lead compounds — chemicals known to cause cancer and reproductive harm. Wash hands after handling.

Before servicing batteries on your apparatus, become familiar with safe handling techniques. Batteries give off hydrogen gas that is highly explosive. Keep all sources of ignition away when working around batteries, including matches, lighters, and cigarettes. Sparks caused by connection of battery terminals, jumper cables or charging systems can be a source of ignition. Whenever disconnecting battery terminals, always disconnect the ground terminal first. When reconnecting, always connect the ground terminal last. Do not attempt to jump-start a vehicle having a frozen battery because the battery may rupture or explode. If a frozen battery is suspected, examine all fill vents on the battery. If ice can be seen, do not attempt to start with jumper cables. Thaw out battery before jump-starting or recharging.

Battery Charging

Never disconnect a battery while charging: this could cause sparks.

Do not use battery charging equipment in the rain, in areas used for washing or in damp areas.

Gases generated during charging are explosive. Do not smoke in the vicinity of the batteries. Use battery chargers only in well ventilated areas.

Before starting to charge, make sure the voltage of the equipment suits the voltage of the battery, that the charging current suits the capacity of the battery and that the selected charging curve (for lead-acid batteries or airtight gel batteries) is correct for the type of battery to be charged. In addition, make sure the rated input voltage of the charger suits the available supply voltage and the system is equipped with grounding.
High Pressure Hydraulic Fluid

Your apparatus develops high pressure fluid in the fuel lines of your engine. You may also have features powered by high pressure hydraulic fluid. If you see or suspect a fluid leak, shut down the equipment and call a service technician trained in safe methods of troubleshooting and servicing high pressure equipment.

Never search for leaks with your hands or other body parts. High pressure fluid can penetrate skin. Use a piece of wood or cardboard to detect leaks, keeping hands and other body parts well away from the potential source of the leak.

If you suspect that you have been exposed to high pressure fluid through skin penetration, seek medical help immediately. The high-pressure injection of a fluid such as fuel, hydraulic oil, grease and paint constitutes a medical and surgical emergency, requiring access to appropriate, surgical specialists as soon as possible. Often, the injury appears minor; don’t be fooled. Fluids injected under the skin are highly toxic. The injury will lead to gangrene, amputation or death if not treated promptly.

Aerial Device Equipment Mounting

Anything mounted on your aerial device subtracts from the load capacity. Your load chart assumes that you have not mounted any additional equipment or modified the device in any way. Never add any equipment or mounting provisions that add weight to the device without written permission from this manufacturer.

Aerial Device Inspection

Your aerial device is a complex machine that requires constant care and thorough inspection. Study your aerial device’s manufacturer’s operation and maintenance manuals, the IFSTA Pumping and Aerial Apparatus Driver/Operator Handbook, and the NFPA 1911 Standard for the Inspection, Maintenance, Testing and Retirement of In-Service Automotive Fire Apparatus to determine the critical points on the device that should be regularly inspected. Inspect these points and look for signs of wear, corrosion or impending failure.

Critical points of inspection should include, but not be limited to:

- Pins.
- Cables (Wire Rope).
- Sheaves.
- Lighting.
SAFETY

- Cylinders.
- Wire Insulation.
- Wear Pads and Surfaces.
- Weld Joints.
- Electrical Cabling.
- Mounted Equipment.
- Slip Resistant Surfaces.
- Structural Members.

Follow the NFPA 1911 recommendations for annual inspection.

[WARNING]

Inspection Required
Follow the instructions in the operator's manual and NFPA 1911 for daily, frequent, and annual inspection and maintenance.

Operation of a poorly inspected aerial device may injure or kill.

Radiator Cap

The radiator cap serves an important function. It holds the pressure of the cooling system so that coolant flows continuously through the radiator. You may need to remove the radiator cap on occasion to fill the radiator with coolant or to test the cooling system. Before attempting to remove the cap, allow the radiator to cool down completely. The cooling system is both hot and under pressure. At normal operating temperature, the coolant can reach several hundred degrees Fahrenheit, cause serious burns on your skin, or cause you to go blind if it gets into your eyes. To prevent splashing, cover the cap with a rag.

Seat Belt Inspection and Replacement

You should inspect the seat belt components of your apparatus regularly to ensure they will function properly in a crash. Webbing can be abraded, soiled, or torn more quickly in a fire apparatus than in your personal vehicle due to the heavy duty service they will experience. The entire seat belt assembly should be inspected for corrosion, wear, fraying, or weak spots. The retractor, latch and buckle should be checked for proper function, and all seat belt mounting bolts should be tight at all times.

Seat belt webbing should be considered for replacement at least every five years. Replace seat belts as a complete assembly. Replace any seat belt assembly that is exposed to a serious crash before the vehicle is placed back in service.

Do not bleach or dye seat belt webbing. Bleaching or dyeing may cause a severe loss of belt strength resulting in failure during a crash.

FAMA39 Do not point over this label. Replace if damaged or lost
Inspect the seat belts as follows:

- Webbing should be free from frays, cuts, and excessive wear. Pay attention to the area near the buckle latch plate and in the D-loop guide area.
- Webbing should be clean, and not severely faded from exposure to the sunlight.
- Buckle receiver should slide together easily with a positive click when they latch.
- Sliding Komfort Latch® should operate properly.
- Seat belt retractor should retract the webbing completely with no or minimal assistance.
- All mounting bolts should be tight.

**Side Roll or Frontal Crash Occupant Protection**

Your apparatus may be equipped with inflatable occupant restraints (air bags), seat belt pretensioners, and suspension seat pull-down devices. These devices operate in a split second and are powered by pyrotechnic (explosive) charges. Never attempt to remove, modify, or repair any of these devices without the express permission and instructions from a factory representative. Tampering with or removing an inflatable occupant protection system sensor (the black box that controls the firing of the devices) can cause the devices to fire which may lead to injury or death. Consult the factory before attempting any removal, modification or repair of any air bag, air bag sensor, seat belt pretensioner, or suspension seat pull-down device.

Pyrotechnic devices can be dangerous if modified or removed. When activated in a crash or rollover they will exhaust harmless blue smoke. Never service, attempt to salvage, or reuse side roll or frontal protection components. Never weld or apply heat on or near side roll or frontal protection components. Never grind, puncture, or drill on side roll or frontal protection.

Information on all component caution and warning labels must be complied with. Labels are placed in visible locations on each component of the Side Roll Protection System. If labels have been removed or are not visible, please contact your customer service representative for the proper replacement labels.

After one of these systems has been deployed, the major components cannot be reused. The Suspension Seat Safety System (S4S), roll & slave sensor(s), Integrated Gas Pretensioners (IGP) / Integrated Belt Pretensioners (IBP), and Inflatable Head Curtains (IHC) / Supplemental Restraint Airbags (SRA) must be replaced. In addition, the wiring harnesses will require inspection and possible replacement. After all system components are inspected and/or replaced, the integrity of the system must be checked by an authorized technician. This service must be performed by a service facility authorized by customer service.

**Suspension Seat Tethers**

Your apparatus may include a suspension seat that uses a seat tether. Inspect each suspension seat and identify any web-type tether that connects the suspension seat to the cab floor structure. If the tether includes an adjustment feature, ensure that it is adjusted to allow full travel of the seat suspension only. The tether should be taut when the seat is adjusted to its full forward and upward excursion of travel.

**Tire Inflation Pressure**

Proper tire inflation is vital to the safety and performance of your apparatus and should be checked with an accurate tire pressure gauge only. Never reduce inflation pressure to attain a softer ride. Under-inflation causes excessive flexing within a tire, resulting in heat build-up which can cause a blowout. An under-inflated tire running at highway speeds and under heavy load can cause severe handling problems.
**Tire Wear Inspection**

Inspect tires for signs of abnormal or excessive wear. Sufficient tread depth is essential to proper handling and braking performance. Refer to the tire manufacturer’s manual for minimum tread depth requirements. Replace tires before minimum tread depth is reached.

Tire tread life is dependent on many factors including the following:

- Tire load.
- Brake power.
- Engine horsepower.
- Suspension alignment.
- Proper inflation pressure.
- Frequency of tight cornering maneuvers.
- Driving habits of acceleration and braking.
- Tire footprint (area of rubber in contact with the road).
- Tandem scrub (inherent to all non-steering tandem suspensions).
- Frequency of dry-steer maneuvers (steering the vehicle in the absence of forward motion).

**Tire Replacement**

Tire rubber degrades over time, even if the tire is not used. Replace your tires after they have been on the apparatus for more than seven years, even if the tread is still satisfactory.

The tires installed on this vehicle at the factory as original equipment are certified for compliance with federal greenhouse gas and fuel efficiency performance regulations. In order to maintain the same level of tire performance, replacement tires must be of equal or lower rolling resistance level (TRRL or CRR). Consult with your tire supplier(s) for appropriate replacement tires.
Manual Parking Brake Release (Caging the Brakes)

If your apparatus must be towed and sufficient air brake pressure is not available, the spring brakes will need to be manually released or “caged.” Remember that caged brakes will not hold your apparatus from rolling. Never leave a vehicle with caged brakes unattended, park it on flat surface only, and chock the wheels in both directions before caging the brakes. Perform lock-out/tag-out to secure the vehicle and make sure no one drives it or removes the wheel chocks until repairs are complete.

Line-Voltage Components and Wiring

Your apparatus may be equipped with a line-voltage generator that produces high 120V, 240V, single or three-phase alternating current. Line voltage generators, components, wiring, and circuit protection should be maintained by qualified and authorized electricians trained in all aspects of the National Electrical Code (NEC) safety practices.

Disconnect power before removing any line voltage breaker box cover or junction box cover or working on line voltage wiring. Follow National Electrical Code safe practices. Electrical shock can injure or kill.

To avoid property damage, personal injury, or death, refer to the component manufacturer’s service information before working on any high voltage equipment. By definition, high voltage circuits and components contain voltage levels that may cause equipment damage, electrical shock and/or electrocution if handled incorrectly.

All electrical circuits associated with Auxiliary Power Units (APUs), shore power, and inverters should be considered high voltage.

Shoreline Electrical Connection

Your apparatus may include an electrical connection to keep the batteries charged while in the station (commonly referred to as a shoreline connection). A compatible power cable is required to make this connection. It is essential that the source of power is the correct electrical phase, polarity, voltage and current capacity. Refer to the placard near the shoreline connection. Only connect the vehicle to a trusted source that you are sure meets these criteria and NEC and local electrical codes.

Wire Rope Inspection or Maintenance

Your apparatus may use wire rope (cable) that needs to be inspected or serviced. Wire rope, through use, can develop “barbs” which can slice skin. It is extremely important to wear protective gloves while handling wire rope. Avoid loose fitting clothes or anything that could become entangled in the wire rope and other moving parts.

Air Conditioning Refrigerant

Use only refrigerants approved for use in air conditioning systems. Some unapproved refrigerants are flammable and can explode, causing injury to personnel. The air conditioning system contains refrigerant under high pressure. To avoid risk of personal injury or damage to the system, only a certified technician should add refrigerant or perform any repair requiring lines to be disconnected.
Towing Your Apparatus

Only allow your apparatus to be towed by a trained, authorized, and experienced tow operator. Tow only with a sufficiently capable heavy duty wrecker. To prevent damage, injury or death,

- Do not lift apparatus from front bumper or front bumper extensions.
- Only lift apparatus from front axle, front suspension, or chassis frame rail or frame rail crossmember that is bolted directly to the frame.
- Disconnect the driveline or remove the axle shafts from the drive wheels.
- The wrecker operator is responsible for following all warnings associated with equipment, controls, and operation.

No-Spin or Locking Differentials

If your apparatus is equipped with a No-Spin or Locking Differential be sure to distribute the load evenly side-to-side; do not exceed the vehicle’s rated payload capacity; keep the diameter of the tires equal. Failure to observe these measures can create a difference in individual wheel speeds which can cause the No-Spin or locking differential to deliver power to only one side of the vehicle and thus cause steering problems.

Turn the engine off and raise all driving wheels of a No Spin or locking differential equipped axle when changing tires to prevent the vehicle from moving. Axles equipped with No-Spin or locking differentials deliver power to both wheels - even when only one wheel is on the ground.
CONTROL DESCRIPTIONS

OVERVIEW

This section of the Operator’s Manual describes the controls you will need to be familiar with to safely and properly operate your aerial device. Section 3 of this manual will go on to explain how to use these controls for safe and proper operations. As fire apparatus are by nature customized to the needs of particular departments, your aerial apparatus controls may have certain variations from the descriptions in this section. If you need assistance or further explanation, contact your department safety or training officer. If further assistance is needed, contact your local dealer representative or contact the factory directly.

AERIAL RELATED CONTROLS IN THE CAB

Cab controls

Parking Brake - Engages the service brakes on either the rear axles, or all the axles (optional), when activated.

Transmission Selector Pad - Controls transmission gear selection.

Aerial Master Switch - Engages electrical power to the aerial device control systems.

PTO Switch - Engages the drive to the aerial hydraulic pump.

High Idle Switch - Raises engine speed to optimal rpm for aerial operation. Will not engage if fire service pump is engaged.

Device

1. Lower Boom - The first boom section between the turntable rotation bearing and the knuckle
2. Upper Boom - The second boom section between the knuckle and the Bucket
3. Platform Bucket - The platform attached to the upper boom for carrying personnel
4. Primary Operator Station - Control station at the rear of the apparatus from where the device is operated.
5. Secondary Operator Station - Control station in the Platform Bucket
6. Boom Cradle - Supports the boom when device is stowed.
Figure 3-1. Device locations
Stabilizer Controls

Figure 3-2. Stabilizer controls

1. **Front Stabilizer** - Provides stability for the apparatus during aerial operation.
2. **Rear Stabilizer** - Provides stability for the apparatus during aerial operation.
3. **Stabilizer Foot** - the part of the Stabilizer that makes contact with the Stabilizer Pad.
4. **Stabilizer Pad** - Device placed under the Stabilizer Foot to distribute load to the ground.

Figure 3-3. Stabilizer pads
5. **Level Indicator** - The level indicators assist the operator in setting up the apparatus as level as possible and center provide the load limit based on apparatus leveling.

6. **Stabilizer Controls** - Deploys and retracts both stabilizers on the same side at the same time.

7. **Stabilizer Deployed Indicator Lights** - These lights are green in color and will illuminate individually as each stabilizer is determined by the system to be deployed satisfactorily for aerial operation.
8. **Stabilizer Individual Controls** - Deploys and retracts each stabilizer individually

![Figure 3-6. Stabilizer not set](image)

9. **Stabilizers Not Set** – Red light that illuminates if the stabilizer cylinder pressure drops below the set pressure. This indicates that the stabilizers are not extended far enough. This light will not illuminate once the boom is out of the cradle since at that point the stabilizer pressure is allowed to fluctuate as the Snorkel is operated.
AERIAL CONTROLS - PRIMARY OPERATOR STATION

Figure 3-7. Primary Operator control station
1. **Hydraulic Filter Indicator** – Illuminates when the back pressure in the filter increases to a point where the filter should be replaced.

2. **Landing Light** - Turns on the lights beneath the Snorkel Platform Bucket.

3. **Fast Idle** - Increases the engine speed to the High Idle setting for faster aerial operation.

4. **EPU Switch** – Engages the Emergency Power Unit (EPU) hydraulic back-up motor and pump.

5. **Hydraulic System Pressure Gauge** – Shows hydraulic system pressure during operation.

6. **Aerial Control Joystick** – Controls the motion of the lower boom, upper boom, and device rotation.

7. **Aerial Control Joystick Trigger** – Pulling the trigger enables the joystick functions. Letting off on the trigger stops all aerial device motion.

8. **Hourmeter** – Indicates the number of hours the aerial master switch has been engaged.

9. **Master Switch** – Provides power to the aerial device.

10. **Aerial Override** – Overrides the interlocks and allows operation of the aerial device to get out of a situation where the system has shut down to prevent device damage. Activating the Aerial Override allows only two functions; the Lower Boom to be RAISED, or the Upper Boom to be LOWERED.

11. **Lower Boom Locked Indicator** – Illuminates if the operator puts the aerial device into a situation where the leveling function causes the platform bucket to get too close to the upper boom.

12. **Upper Boom Locked Indicator** – Illuminates if the operator puts the aerial device into a situation where the leveling function causes the platform bucket to get too close to the upper boom.

14. **Monitor Nozzle Sweep** – Sweeps water monitor nozzle left and right.

15. **Monitor Nozzle Pattern** – Changes water monitor nozzle pattern between stream and fog.

16. **Monitor Stow** – Moves the water monitor into a stowed position.
Figure 3-8. Controls

17. Communications Controls - Adjusts the volume and controls speech communication with the secondary operator in the platform.

18. Water Monitor Control - Valve to provide water pressure to the water monitor.

19. Aerial Inlet/Outlet Pressure Gauge - Master water pressure gauge.

20. Emergency Shutdown Alarm - Audible alarm that sounds when the device enters an Aerial Over-ride conditions.
AERIAL CONTROLS - SECONDARY OPERATOR STATION

Figure 3-9. Secondary Operator Station
21. **Emergency Stop** – Stops all aerial device functions from being controlled at the platform bucket.

22. **Hose Line Connection Valve** – Controls water to the hose line connection located on the front of the platform.

23. **Fog Curtain Control** – Controls flow of water to sprinklers on the bottom of the platform bucket.

24. **Bucket Interference Interlock Sensors** – Sends signal to the system when the platform bucket approaches the upper boom.

**TRAVEL MODE LOCKS**

![Figure 3-10. Mode Locks](image)

1. **Boom Travel Lock Hook** – Clips to the upper boom to lock it down for transit.

2. **Boom Travel Lock Lever** – Engages the Boom Travel Lock

![Figure 3-11. Travel Bar](image)
3. **Platform Travel Bar** - Stores on the back side of the platform bucket and swings into place to secure the platform for transit.

![Figure 3-12. Travel Bar Lock](image)

4. **Platform Travel Bar Lock Lever** - Locks the travel bar into place.

5. **Platform Travel Bar Lock Pin** - Keeps the Travel Bar Lock secured during transit.
For future use
OPERATING PROCEDURES

OVERVIEW

Read and follow the instructions found in the Safety Section of this manual before operating.

The procedures contained this section of the Operator’s Manual explain how to safely and properly operate your Snorkel. Any deviation from these procedures increases the risk of an accident occurring. Accidents may result in damage to the apparatus, as well as injury or death to firefighters and other people using this Snorkel.

UNDERSTANDING THE LOAD CHART

![Load Chart Diagram]

**Figure 4-1.  Sample Load Chart - Snorkel**

**Level Indicators**

There are level indicators on the apparatus body. One Level Indicator shows side to side level and the other Level Indicator shows front to back level. There are three color coded ranges indicated. These ranges may vary depending upon aerial device model. Always reference the load chart on your aerial device.

4.1
OPERATING PROCEDURES

1. **Green Range (0 - 2.0°)** - indicates the aerial device can be loaded to 100% capacity.
2. **Yellow Range (2.0 - 5.5°)** - indicates the aerial device can be loaded to 50% capacity.
3. **Red Range (Over 5.5°)** - indicates that the aerial device should not be used.

**Preparation for Road Travel**

4. Illustrates the two locking mechanisms that must be secured on the Snorkel prior to driving the apparatus.

**NFPA 1901 Aerial Device Ratings**

5. This list provides the height, reach, load, and water flow capability as determined per NFPA 1901 standards.

**Aerial Device Loading**

6. This icon indicates the maximum load in the Platform Bucket while flowing water at the rate shown in Aerial Device Ratings (#5), when the apparatus is leveled in the Green Range (#1). The load must be reduced by 50% when the apparatus is leveled in the Yellow Range (#2).

7. This icon indicates the maximum load in the Platform Bucket with a dry waterway, when the apparatus is leveled in the Green Range (#1). The load must be reduced by 50% when the apparatus is leveled in the Yellow Range (#2).

8. **Load Icon** - Stick figure indicates a 250 pound load. A stick figure with a number indicates a load of 250 pounds multiplied by the number in the circle.

**NOTE:** If the Load Chart shows an odd number of personnel allowed, then you must always round down to the nearest whole number of people. For example, if the capacity in the green range is 3 people, then in the yellow range half of 3.0 people would be 1.5 people. Since you can’t have half a person, you must round down to 1.0 person.

**Snorkel Capacity in Red Range (3):** After leveling the apparatus, if either Level Indicator is in the Red Range DO NOT use the Snorkel.

**NOTE:** Always reference the Load Chart provided with your Snorkel for specific allowable loads. This can be found at the PRIMARY OPERATOR CONTROL STATION on the tailboard and at the SECONDARY OPERATOR CONTROL STATION in the Platform Bucket. Optional equipment and department specific requirements may affect the rated capacity of your Snorkel compared with the load chart.

**Operational Requirements**

9. Lists several requirements for Operators before and during aerial device operation.

**Operational Restrictions**

10. Lists conditions that may impact the loading or operation of the aerial device.
Factors that Reduce Live Load Capacity

The load capacity of your aerial platform is based on standard conditions. As the aerial operator, you are responsible for taking into account environmental factors or other non-standard conditions. Such factors or conditions may include:

- Wind
- Snow
- Ice
- Water Monitor Operation
- Hose and Other Added Equipment

Pre-Operation Readiness

Prior to operating your aerial device, inspect the apparatus and aerial device in accordance with Section 4 of this manual and your Department’s procedures.

Read and follow the instructions found in the Safety Section of this manual pertaining to driving and riding safely prior to operating.

Read and follow the instructions found in your Chassis Operator Manual prior to operating.

Before driving your apparatus you must make sure it is safe and in good working order. Follow the pre-trip inspection found in your chassis operator manual.

Before operating the aerial device read and follow the Prepare For Safe Operation instructions found in the safety section of this manual.

PREPARING THE APPARATUS FOR AERIAL OPERATIONS

Selecting a Set-up Site

WARNING

Read and follow the Safe Aerial Set-Up instructions found in the safety section of this manual.

Using a spotter, position your apparatus at a site that meets the following criteria:

- As flat and solid as possible (i.e., reinforced concrete, asphalt, etc.).
- Avoid manhole covers, sewer lids and grates, non-compacted gravel or soil, etc.
- Clear of overhead obstructions such as electrical cables, buildings, trees, etc.
- When possible position the apparatus to operate the aerial over the side or rear to provide maximum reach and low angle operation.
- Position to minimize water monitor spray to avoid ice build-up in freezing temperatures.
- Position apparatus outside of collapse zones or high heat areas.
Provide Aerial Power
To engage the PTO, follow instructions in the chassis manual to start the engine.

1. Ensure the Parking Brake is set.
2. Ensure the Front Wheel Lock is set (if so equipped).
3. Place Transmission Selector in neutral.
4. Ensure that the engine speed is 1200 RPM or less
5. Activate the Aerial Master switch.
6. Activate the PTO switch. (If Equipped.)
7. Deploy wheel chocks.

Engaging the Fire Service Pump after the PTO is in Operation
If the PTO has been engaged and it now becomes necessary to engage the fire service pump, follow these steps.

1. Deactivate the High Idle Switch at any of the control locations.
2. Engage the fire service pump using the procedures found in the pump operation manual.
3. Place the Transmission Selector in drive.
4. The fire service pump and aerial ladder are now both operational. The high idle function is now disabled.
5. Use the fire service pump controller to set the engine speed for required discharge pressure.

Engaging PTO after the Fire Service Pump is in Operation
If the fire service pump has been engaged and the engine speed set to supply pressure, and it then becomes necessary to engage the PTO for aerial or hydraulic generator operation, follow these steps.

1. Lower the RPM’s of the engine to 1200 RPM or less.
2. Activate the Aerial Master switch. (The high idle function is now disabled.)
3. Activate the PTO switch. (If Equipped.)
4. Use the fire service pump controller to set the engine speed for required discharge pressure.
Wheel Chock Positioning

1. Place chocks on those tires that will have the greatest contact with the ground after stabilizer deployment.
2. Place chocks on the down-hill side of tires if positioned on a grade.
3. Place chocks on both sides of the tires if positioned on level ground.

STABILIZING THE APPARATUS

WARNING

Read and follow the Safe Aerial Set-Up instructions found in the safety section of this manual.

Placing the Auxiliary Stabilizer Pads

Auxiliary stabilizer pads should always be used when the stabilizers are deployed and the device is put into operation.

1. Clear all personnel from the stabilizer deployment area.
2. Inform personnel that you are about to set stabilizers.
3. Activate the High Idle switch. (If the fire pump is not engaged).
4. Use the Stabilizer Controls to extend all stabilizers until they are a few inches from the ground.
5. Position a Stabilizer Pad under each Stabilizer Foot.

NOTE: Lining up the inboard edge of the stabilizer pad within the edge of the body will usually place the pad in the correct location.

Leveling the Apparatus

1. Using the Stabilizer Controls, lower the stabilizers on one side of the apparatus, making contact with the ground and raising that side to take the bulge out of the sidewalls of the tires.
2. Lower the stabilizers on the opposite side until the side to side Level Indicator is in the green range, as close to zero degrees as possible and the bulge is out of the tire sidewalls.
3. If the apparatus is parked on a side slope;
a. Lower the stabilizers on the uphill side of the apparatus first, just making contact with the Stabilizer Pads.

b. Lower the stabilizers on the downhill side until the side to side Level Indicator is in the green range, as close to zero degrees as possible.

**NOTE:** Refer to load chart and Safety Section of this manual for operation in the yellow range.

4. Ensure that at least one tire is in contact with the ground and that it has been properly chocked.

5. Ensure that all green Stabilizer Deployed Indicator Lights at the stabilizer control station are illuminated and the warning signal has stopped sounding.

### DEVICE OPERATIONS

*Read and follow the Operate Your Aerial Safely instructions found in the safety section of this manual.*

#### Unlocking The Bucket

1. Climb onto the tailboard platform using the three points of contact method.

2. Detach the Boom Travel Lock Hook from the boom.

3. Detach the Platform Travel Bar from the apparatus and secure the bar in its holder on the back of the Platform Bucket.

#### Operation From Primary Control Station

1. If operating at night, turn on scene lights, device lights, and/or spot lights and search the operating area for potential hazards.

2. Determine the wind speed and ensure that it is below the maximum allowable wind speed (see load chart).

3. Consider the following conditions and determine whether load chart values will need to be modified to accommodate your environment:
   - Wind speed.
   - Icing conditions.
   - Apparatus leveling (green or yellow zone on the apparatus level indicators).

4. Look for obstacles in your path and plan out how you will avoid them and maintain safe distance from power lines.

5. Keep people away from the device and other parts on the device that will move.

6. Assign spotters to help you avoid hazards that are not visible to you.

7. Place Master Switch in ON position.

8. Communicate to spotters and personnel in the area that you intend to move the aerial device.

9. Activate the Fast Idle switch. (Do not do this if the fire pump is in use.)
10. Move the device slowly and smoothly by squeezing the Aerial Control Joystick Trigger while performing the following motions:

11. Upper Boom
   • PUSH forward on the Aerial Control Joystick to raise
   • PULL back on the Aerial Control Joystick to lower

12. Lower Boom
   • PUSH to the right on the Aerial Control Joystick to raise
   • PUSH to the left on the Aerial Control Joystick to lower

13. Rotation
   • Rotate the Aerial Control Joystick in the direction you want the device to rotate

Access The Bucket

1. Raise the Upper Boom so that the Platform Bucket is about 5 feet above the apparatus.

2. Raise the Lower Boom and adjust the Upper Boom until the Platform Bucket is at the back of the apparatus near the primary operator station as shown. Rotate the device CCW to provide easy access to the operator platform.

3. Place the Master Switch in the off position.

4. Climb onto the rear step, and then into the platform bucket, using three points of contact method as shown below:

Figure 4-3. Device Orientation of Platform Bucket Access
5. Instruct all bucket occupants to attach fall protection tethers to a fall protection anchor.

6. Place Master Switch in the ON position.

7. Operate the device as desired, either from the Primary Operator Station at the back of the apparatus, or from the Secondary Operator Station in the Platform Bucket.

8. Do not rest the Platform Bucket or any other part of the device on anything - device must remain in cantilever, unsupported, configuration.

9. Approach the ground or any structure slowly and carefully, stopping before you make contact. Your device is not designed for reverse loading and you should never power your device into the ground or onto a structure.

**Secondary Operation from the Platform Bucket**

Your aerial device is equipped with a Secondary Operator Station that will allow an operator in the Platform Bucket to make small adjustments to the device position. This secondary position must only be used with a trained, experienced, and authorized operator at the Primary Operator Station. It is the job of the primary operator to watch for hazards, and to regain control of the device prior to encountering any unsafe condition.
1. Establish communication with the primary operator.

2. Request permission to operate the device from the Secondary Operator Station.

3. Pull up on the Emergency Stop Button to activate the Platform Bucket Controls.

4. Operate the device keeping in mind that the Upper Boom and Lower Boom are behind you. Look behind before moving the device to ensure that the booms are not lowered or rotated into buildings, obstructions, electrical wires, etc...

5. To stop device motion release the Aerial Control Joystick Trigger.

6. Push in the Emergency Stop Button whenever you are not actively in control of the device motion.

NOTE: The Primary Operator can take over control of the device from the Secondary operator at any time by squeezing the Aerial Control Joystick Trigger.

STOWING THE AERIAL LADDER

Stowing the Device

1. Operate the Aerial Control Joystick to place the platform bucket in the proper orientation for Platform Bucket access. (See Figure 3.3.)

2. Place the Master Switch in the OFF position.

3. Allow the Platform Bucket occupants to exit the device using the three points of contact method.

4. Ensure that the Platform Bucket operator has pushed in the Emergency Stop Button before exiting.

5. Place the Master Switch in the ON position.

6. Use the controls at the Primary Operator Station to line up the boom with the Boom Cradle.

7. Check that the Boom Travel Lock Hook is rotated into the down position.

8. Align the boom with the cradle using the arrow on the Turntable as a guide.

9. Lower the device into the Boom Cradle, making sure that the Lower Boom is aligned with the cradle.

10. Ensure that the device is firmly bedded in the cradle and that the Upper Boom rests firmly on the Lower Boom.

11. Turn off any lights that were ON during device operations.

12. Place the Master Switch in the OFF position.

13. Attach the Boom Travel Lock Hook to the Upper Boom.

14. Remove the Platform Travel Bar from the Platform Bucket and secure the bar to the apparatus.
**OPERATING PROCEDURES**

**Stowing the Stabilizers**

1. Check the wheel chocks to make certain they can be removed. Use the Stabilizer Jack Controls to take pressure off of the chocks and reposition if necessary.

2. Clear the area of personnel.

3. Raise the stabilizers on the down-slope side of the apparatus.

4. Raise the stabilizers on the up-slope side of the apparatus.

5. Move the Fast Idle switch to the OFF position.

6. Place the Stabilizer Pads in the pad storage locations.

7. Move the Aerial Master switch to the OFF position.

8. Move the PTO switch (if equipped) to the OFF position, unless required for other apparatus functions.

**DEVICE OPTIONAL FEATURES**

**Pre-Piped Waterway and Monitor**

Your apparatus may be equipped with a pre-piped waterway that will provide a continuous path for water flow from the aerial inlet or fire service pump to the monitor at the tip of the device. To use the pre-piped waterway follow this procedure:

---

**WARNING**

**Read and follow the Work Safely and Pump Safely instructions found in the safety section of this manual.**

1. Deploy the monitor so that the nozzle is directed at the fire.

2. Charge the waterway - Open valves slowly to prevent a water hammer in the piping or a shock load to the device due to excessive nozzle reaction.

3. Do not exceed 240 psi in the waterway system.

4. Watch the flow meter and adjust the pressure to optimize the amount of water flowing.

---

**WARNING**

**Do not exceed the maximum flow capacity as stated on the load chart.**

The automatic nozzle or smooth bore tips may be used on the monitor.

- When using smooth bore tips, select the appropriate size tip for the available water supply.
- Insufficient water flow or poor stream quality may result from improper tip size.

The extended range monitor travels an additional 0 and 30 degrees up past the device centerline.
1. When finished using the pre-piped waterway, shut off the water supply to the device.

2. Shut valves slowly to prevent a water hammer to the fire service pump, water supply hose, and water mains.

3. Drain the waterway system using the following procedure.
   a. Raise the device so that the Lower Boom and Upper Boom are at an angle of at least 30 degrees.
   b. Open the waterway drain valve
   c. When the water is done draining, close all drains.

4. Stow the monitor by either manually positioning the monitor to your department's travel position or, if equipped, by activating the Monitor Stow Switch. Monitor is stowed when the indicator light illuminates.

**Rescue and Firefighting Equipment Stored on Device**

Any equipment that is to be carried on the device must be secured in approved mounting brackets, hardware and enclosures.

- Verify that all equipment is stored in its proper location.
- Verify that all equipment is secured with positive locking devices such as brackets and locking straps, covers, pins, etc.

**OPERATION OF SAFETY INTERLOCK OVERRIDE AND BACKUP SYSTEMS**

**WARNING**

The safety interlocks on your aerial device are intended to reduce the risk of damage, injury or death do to improper operation of the aerial device. The safety of your aerial apparatus is the responsibility of the trained, experienced, and authorized operator. Never rely on interlocks to keep you safe. ALWAYS operate the device properly, within the safe limits as described on the load chart.

Interlock overrides are provided so that you can take charge and bypass the safety interlock in the event that a sensing component fails and this failure is preventing you from stowing your aerial device and removing it safely from service. Safety interlock overrides should never be used in this case to continue normal operation. Remove personnel from the device, operate within the load chart limits, and remove the apparatus from service immediately until it can be properly repaired. The use of any safety interlock override must be appropriate for the condition or situation, improper use could result in death, injury to personal, or apparatus damage.

**Boom and Stabilizer Interlocks**

Your Snorkel Device is equipped with interlocks intended to reduce the risk of operation in conditions where equipment damage may occur.

**Stabilizer Set Interlock** - A sensor in each stabilizer extension circuit measures the pressure in the cylinder indicating that the stabilizer is in contact with the ground. All four sensors must indicate ground contact before the boom can be raised out of the cradle.
OPERATING PROCEDURES

**Boom Stowed Interlock** - A sensor in the cradle indicates if the boom is in or out of the cradle. Once the boom has left the cradle, the stabilizer controls will no longer function.

**Bucket Interference Interlock** - Two sensors in the knuckle indicate when the platform bucket leveling system has caused the bucket to swing too near the upper boom. To avoid mechanical damage, the system locks out the aerial device before the bucket contacts the upper boom. The first sensor sounds an alarm. The second sensor illuminates the **Lower Boom Locked** and **Upper Boom Locked** indicator lamps and stops boom operation. Once this point is reached you must use the **Aerial Override** switch to continue operation. Hold the Aerial Override switch while using the **Aerial Control Joystick**. The system will allow the lower boom to raise, or the upper boom to lower. Either of these functions will cause the bucket to swing away from the upper boom until the **Boom Locked** indicator lamps go out. Once the lamps are out, you can release the **Aerial Override** switch and resume normal operation.

**Emergency Power Unit (EPU)**

Your aerial apparatus includes a backup hydraulic pump to provide emergency hydraulic power in case of an engine failure, main hydraulic pump failure, or loss of hydraulic fluid. The pump is powered by a 12 volt motor that runs off the apparatus batteries, or a 120 volt motor that is powered by a line voltage power source (optional). The EPU's hydraulic pump inlet tube is mounted lower in the reservoir than the main pump inlet. This provides a backup reservoir of sufficient capacity for emergency use only.

---

**CAUTION**

The EPU pump is not intended for frequent or prolonged use.

Never operate the EPU motor without a device or stabilizer control in operation.

When powered by the EPU, the device operates at a slower speed than normal.

The 12-volt EPU has a duty cycle that must be observed or the pump may burn out. The pump may be operated for a maximum of 5 minutes in every 60 minutes. The 120-volt EPU does not have this duty cycle restriction.

Operation of the 12-volt EPU is as follows;

1. Provide Power to the EPU
   - a. Ensure that the engine is running or the ignition switch is in the ON position.
   - b. Activate the **Aerial Master** switch.
   - c. Place the **PTO** switch in the OFF position. (If Equipped.)

2. Aerial Operations
   - a. Activate the control for the motion desired.
   - b. At the same time activate the EPU motor using the **EPU Switch**.
   - c. When the movement is complete release the control and the **EPU Switch**.
   - d. Only operate one aerial motion function at a time.
   - e. Repeat this process until the device has been stowed.
f. Monitor the duty cycle time - If you reach 5 minutes of operation and stowing is not complete, stop operations for about one hour to let the EPU cool off.

3. Stabilizer Operations
   a. Actuate one of the Stabilizer Controls.
   b. At the same time actuate the EPU motor using the EPU Switch.
   c. When the movement is complete release the Stabilizer Control and the EPU Switch.
   d. Only operate one function at a time.
   e. Repeat this process until all the stabilizers have been retracted fully.
   f. Monitor the duty cycle time - If you reach 5 minutes of operation and stowing is not complete, stop operations for about 1 hour to let the EPU cool off.

MANUAL OVERRIDES - SNORKEL

In the event of partial or total electrical failure, emergency manual overrides can be used to stow the snorkel and the stabilizers. The failure may be of the electric over hydraulic snorkel controls or failure of the apparatus electrical system, including engine shutdown.

**WARNING**

When the Snorkel is controlled by the manual override valves, safety interlocks are not operational. Operation must be supervised by a trained and authorized Snorkel operator. Spotters must be positioned so that the upper and lower boom angles and any obstructions can be observed. Clear communication between the spotters and the snorkel operator is essential.

The emergency power unit (EPU) on the snorkel is wired battery direct, and therefore will operate in any situation short of total battery power drain or failure. Should you lose the multiplex system or master and ignition power, the EPU will need to be used as the PTO will not engage the primary hydraulic pump.

Whenever manual overrides are used, a spotter must be positioned to watch all snorkel movements and stop operations if necessary. If the EPU is required, another person may be required to operate the EPU control switch while the Snorkel operator controls the aerial device or stabilizers.

**WARNING**

These overrides should only be used to stow the aerial device and stabilizers, and remove the apparatus from service for repair. These overrides are not intended to provide operation of the aerial device for training or emergency operations.
Open the Primary Operator Control panel to access the Diverter Valve.

- Remove the Waterway control valve handle by remove the shaft pin and sliding the handle off the shaft.

- Release the latches on the right side of the panel.

The Diverter Valve is located on the right side of the pedestal.

The solenoids are labeled with either “Boom Valve” (Snorkel) or “Jack Valve” (Stabilizers).

Select the bypass knob for the operation you need to perform.

Open the manual bypass by pushing down on the knob, rotating it counter clockwise until it stops (About 1/4 turn) and releasing it. The knob will pop up to indicate it is open.

**WARNING**

When the Diverter Valve is manually opened, safety interlocks associated with this valve are no longer operational.

Only open one bypass at a time, never both at the same time. With both valves open, the Snorkel can be operated without stabilizers set. Open the override for the Jack Valve, once completed close that override. Then open the override for the Boom Valve, once completed close that override.

ALWAYS deploy the stabilizers before operating the Snorkel. NEVER operate the Snorkel while the stabilizers are not deployed.

To close the manual bypass, push in the knob, rotate it clockwise until it stops (About 1/4 turn), and release it. The knob should not pop out.
The Snorkel Valve Bank uses manual pull handles on the hydraulic valves as the override option.

To manually operate the Snorkel,

Open the Primary Operator Control panel to access the Diverter Valve.

- Remove the Waterway control valve handle by remove the shaft pin and sliding the handle off the shaft.
- Release the latches on the right side of the panel.

Locate the Diverter Valve and open the "Boom Valve" bypass knob.

Locate the Snorkel Valve Bank inside the rear door, mounted on the left side of the pedestal.

The valve bank has three manual pull handles -

- One operates the lower boom.
- One operates the upper boom.
- One operates turntable rotation.

When Snorkel operations are completed, close the "Boom Valve" bypass knob on the Diverter Valve.
This type of valve requires a special tool to operate the manual override.

This type of valve requires no special tool to operate, however a glove or wooden dowel may assist in depressing the button.

**Figure 4-7. Manually Overriding the Stabilizer Electric Controls**

*NOTE: Extending the stabilizers is accomplished using the overrides located inside the pedestal. Stowing the stabilizers is accomplished using the overrides accessible from under the apparatus.*

There are two different styles of overrides. One type has “concealed” overrides, which require a special tool (see picture below) or something like a small Allen wrench to operate. The other type has push buttons.

With a spotter in position, the operator will activate the appropriate override to stow a stabilizer.

- For "Concealed" type valves - Turn the wrench counter clockwise until the stabilizer moves. Once the stabilizer reaches the appropriate position, turn the wrench clockwise until it is tight.
- For Push Button type valves - Push in the button until the stabilizer moves. Once the stabilizer reaches the appropriate position, release the button.

When stabilizer operations are completed, close the "Jack Valve" Bypass Knob on the Diverter Valve.

**After Manual Operations are Complete**

Once manual override operations are complete (Snorkel and stabilizers are stowed), the operator should,

- Check that both bypass knobs on the diverter valve are in the closed position.
- Close and secure the Primary Operator Control Panel.
- Put the Waterway Control Valve handle back on the shaft.
SERVICE PROCEDURES

INTRODUCTION

This section of the operator’s manual provides guidelines for service checks, inspections and preventive maintenance that need to be conducted on your aerial device. The items to check and the frequency of the inspections are provided. It is paramount that required inspections and preventive maintenance be properly performed to ensure that the aerial device operates safely and properly. Failure to perform the service procedures, inspections, and preventive maintenance found in this manual will void the warranty.

Some of the inspections are simple visual checks of the aerial device. Other inspections require hands-on operation of the stabilizers and aerial ladder. It is recommended that the inspection, maintenance and testing procedures in this manual and the procedures from the latest edition of the NFPA 1911 - Standard for the Inspection, Maintenance, Testing, and Retirement of In-Service Automotive Fire Apparatus be followed to ensure safe, efficient and dependable aerial operation.

PREVENTIVE INSPECTION MAINTENANCE

Field Inspection Check List:

This inspection should be conducted at least every six months or more often if unit is subjected to extensive use within short periods of time.

1. **Mainframe - Underneath Chassis:**
   a. Check mainframe for visible damage such as weld cracks, dents or bends.
   b. Check bolts holding rotation gear to mainframe for tightness. If loose check torque rating before tightening.
   c. Check mainframe tie down bolts for tightness.
   d. Check all valves for free working spools and any oil leaks.
   e. Check all hydraulic fittings for leaks and tightness.
   f. Refer to lubrication instructions.
   g. Check hydraulic hoses for leaks, cuts, abrasions, etc.
   h. Check all wiring for excessive wear.
   i. Check PTO and pump for leaks.

2. **Mainframe - Cargo Area:**
   a. Visually check pins holding stabilizer cylinders in place for proper installation.
   b. Check hydraulic reservoir area for leaks.
   c. Check boom support for visible damage such as weld cracks, dents or bends.

3. **Turntable and Area:**
   a. Check turntable for visible damage such as weld cracks, dents or bends.
b. Check bolts securing rotation mechanism for tightness.

c. Check hydraulic hose for leaks, cuts, abrasions, etc.

d. Check centerpost manifold for hydraulic leaks and make sure securing bolts on top of centerpost are tight.

e. Check water pipe Victaulic couplings for tightness.

f. Check pins securing lower cylinder and securing bolts for proper installation and tightness.

g. Check manual upper boom lock for operation and fit.

h. Check rotation motor for hydraulic leaks at shaft.

i. Check leveling arm anchor pins and retaining bolts.

j. Check electrical connectors and wire securing clamps.

4. **Boom Lower:**

Place lower boom in support (road travel position). Raise upper boom approximately 45 degrees.

a. Check all boom pivot pins and upper cylinder pins for proper installation and fasteners for tightness.

b. Check boom for visible damage such as weld cracks, dents or bends.

c. Check all hydraulic hoses, tubing and connections for leaks.

d. Check leveling arm brackets and retaining bolts.

e. Check leveling arm support brackets, pins and retaining bolts.

f. Check water pipe brackets and U-bolts.

g. Check welds on bottom side of upper boom.

h. Check condition of upper boom rubber support pads.

5. **Booms Upper:**

Return upper boom to road travel position.

a. Check boom for visible damage such as weld cracks, dents or bends.

b. Check water pipe brackets and U-bolts.

c. Check leveling arm support brackets, pins and retaining bolts.

6. **Operator’s Platform:**

a. Check entire basket for visible damage such as weld cracks, dents or bends.

b. Check control for free movement in all modes of operation.

c. Inspect water nozzle in accordance with manufacturer’s literature.

d. Check electrical terminal block nuts and wire securing clamps.
e. Check below platform shower nozzle valve for freedom of movement.
f. Check deck gun water shut off valve for freedom of movement.
g. Check basket stabilizer for proper adjustment.
h. Check level rod pins for proper installation and tightened fasteners.
i. Check level rods for visible damage such as weld cracks or bend areas.
j. Check level rod brackets for weld cracks or bend areas.
k. Check points of attachment of level rods to basket.

7. **Operational:**
   a. Lower control station.
      1. 3 Spool Boom Valve for any sticking or binding.
      2. 4 Spool Stabilizer Valve for any sticking or binding.
      3. Stabilizer and Aerial blocking solenoid.
      5. With Engine at normal running temperature.
         • Engine Speed ___________________________
         • Hydraulic Pressure ________________________

The following tests are to be made and adjustments made accordingly.

   6. Lower Cylinder Drift Test ____________________
   7. Upper Cylinder Drift Test ____________________

Rotate 360 degrees in both directions checking the communications for excessive static or any skipping.

**General Lubrication Instructions:**

The illustration below locates the lubrication points on the Snorkel.

1. Gear Reduction Unit - one fitting.
2. Gear Reduction Unit - check oil level.
4. Hydraulic Oil Reservoir.
5. Rotation Bearing - one fitting.
6. Rotation Gear Teeth and Pinion.
7. Pivot Pins.
Lubrication of accessory equipment should be in accordance with manufacturer's recommendations. Detailed lubrication instructions contained in appropriate manufacturer's literature.

Service all fittings as indicated in illustration and wipe all excess lubricant from exposed surfaces. Good housekeeping makes a unit much easier to maintain and keep clean and offers a safer working area.

**LUBRICATION POINTS:**

1. **Gear Reduction Unit - One Fitting.** Grease with multi purpose EP chassis lubricant.

2. **Gear Reduction Unit - Oil Level.** Fill with SAE 80W-90 gear lubricant, to level plug on side of gear box.

3. **Water Pivot Joints - Booms Assembly and Turntable Pivot.** These joints form a hinge pin through which there is a water passage at both end of telescopic boom. They are sealed with "O" rings lubricated at the factory and equipped with teflon lubrication free bearings and should require no further lubrication, unless disassembled. If disassembled, before installing pins, they should be lightly lubricated with Parker "O" ring lubricant or a good grade of water resistant chassis lubricant. Fill cavity around pin at nozzle pivot pin. Remove plug in pin retainer bolt and insert grease fitting, grease, remove fitting and replace plug.

4. **Centerpost Pivot through Center of Pedestal.** The swivel joint located inside the mainframe pedestal (TO allow turning of the turntable) is permanently lubricated.

5. **Hydraulic Oil Reservoir.** Fill to full mark on the dipstick with all cylinders in fully retracted position. After initial start up and all hydraulic cylinders and lines are charged, check and refill reservoir to full mark on the dipstick, again with all cylinders in retracted position.

6. **Rotation Bearing - Four Fittings.** Lubricate bearing through fittings located on bottom side of gear yearly or every 500 hours operating time. Above 32°F use Number 2 grade extreme pressure grease. (Example: Mobilplex EP#2.) Below 32°F use Number 1 grade. Rotate while greasing.
7. **Rotation Gear Teeth and Pinion.** The gear teeth and pinion are greased at factory and heavy EP gear lubricant and should need no further lubrication unless unit is disassembled.

8. **Minor Hinge or Bearing Points.** Ref. Valve linkage, lubricate lightly with 10W oil. IF equipment is operated in extremely dusty or sandy environment the components should remain dry.

A **Pressure Line Filter** is located beneath the chassis frame on the left hand side adjacent to the emergency motor/pump. Easily accessible from beneath frame. This is a full flow type filter with a disposable element (3 Micron absolute rating).

A **Red Rattler Light** is provided on the operator’s control station to indicate that the element is clogged and requires attention. The light will remain lit while the hydraulic system is in operation and the element is in need of change. This indicator light is of the "**Press to Test**" type and should be checked daily or whenever unit is operated to insure it is functional. This filter element should be changed anytime the light is lit during operation.

1. **Hydraulic Fluids.** The recommended fluids for this system are Peak ISO 32 oil. These fluids were selected for use in the "55 SFF" hydraulic system because of their good lubricating qualities in high pressure systems. A substitute should not be used without approval from Ladder Tower Company. Both of these fluids are classified as all weather oil for general summer or winter usage. Peak ISO 32 oil is used for factory fill. DTE-11 is recommended in the event continued operation and/or start up is below 10°F.

2. **Operating Temperature.** The operating temperature of the system should not exceed 80°F above ambient outside temperature. (Example: With machine operating on a day when outside temperature is 100°F the fluid in the system should not exceed 180°F.) If it is suspected that temperature of system is high, it may be checked by inserting a good fluid thermometer into fluid in reservoir. High temperature could be caused by a badly worn pump, or one of the pressure control valves improperly adjusted.

3. **Pilot Operated Holding Valve.** Your unit is equipped with a dual overcenter holding valve on the lower cylinder. The upper cylinder has a single overcenter holding valve gasket mounted to base end of cylinder. These pilot operated holding valves provide a positive lock and prevent any boom movement due to loss of line pressure from engine failure or line breakage. The lower cylinder holding valve is equipped with a manual release screw. This enables you to bleed down the lower boom without altering the adjustment of the holding valve. While bleeding down the boom, have someone near the boom control valve so that the valve is not accidently touched. Position yourself so that you are not under the boom in case it should lower unexpectedly during lowering procedure.

![Figure 5-2. Holding valve](image)

a. To bleed down the lower boom, loosen jam nut (9/16) on manual release screw. Using Allen Wrench (3/16), **slowly** screw protruding stem FULL IN, the holding valve is now overridden, **Slowly** move the lower boom control handle (lower station control valve) in the boom "Down" position to lower boom.
b. When the boom has been bled down, turn release screw FULL OUT and tighten jam nut, thus returning holding valve to operational condition without altering setting. The overcenter valves are adjusted at the factory and should not require any further adjustment. Should it become necessary to adjust one of these valves, you must remove from unit and take to a hydraulic test bench where a steady pressure can be applied. The dual overcenter valve is two separate valves in one body, so both sections must be checked.

Lock Valve - Stabilizers

Pilot operated check valves are provided on each of the stabilizers only to prevent retraction of legs until hydraulic pressure is applied. There is no adjustment of valves. Any malfunction will require repair or replacement.

REPAIR MAINTENANCE

This part of the Maintenance Section is devoted to the more extensive problems which occur less frequently than others and usually after the unit has been in service for a considerable length of time.

Internal leaks are most common in the boom operating cylinders and are usually evidenced by slow operation, boom creepage or both. This leakage is a bypassing of oil internally past the piston as a result of wear, seal damage, or other internal parts damage.

The first reference to consider for improper hydraulic system operation should always be this manual. References are made in manual as to pump speed settings, throttle setting, pilot operated checks valves, and hydraulic relief valves. If after through inspection, the trouble is not detected and corrected in those components, it is likely an internal leak has developed in the cylinders or check valves due to worn parts or seals.

Internal leaks are usually evidenced by extremely slow operation and boom creep when platform is loaded near its rated capacity, and careful adjustment of hydraulic components fails to remedy the problem.

Test Procedure

Before removing any hoses or tubes while in the process of checking components for internal leakage, adequate support must be properly positioned to eliminate any danger of boom dropping on personnel on/or around unit.

Because internal leaks must be traced through a process of elimination, particular care should be taken when performing the test procedure as an improper test may give the wrong determination, which will result in unnecessary removal and replacement of parts.

To determine which component is defective, perform the following procedure.

**CAUTION**

Prior to proceeding with the upper cylinder test below, check to see that emergency bleed down valve is closed and not leaking.

Upper Cylinder Test

1. Place the hydraulic system in operation with booms in road travel position and a normal working load in platform. Attach a line or tape measure to the bottom of the platform to hang below (a tape measure is best). Operate upper boom control lever at ground control station to raise upper boom
about 8 or 9 feet above the lower boom at the turntable hinge point. Shutdown the hydraulic system. Actuate the upper boom control at ground control station to "DOWN" position. If the boom descends more rapidly with movement of the handle, pilot check valve is out of adjustment or faulty and should be adjusted or replaced. If the boom does not descend more rapidly with movement of the handle, proceed with the remainder of the test.

2. Disconnect fitting ("B" on diagram 1) from tee ("C" on diagram 1) in tube running to rod end of cylinder. Plug the end of the hoses with some suitable means in order to reduce loss of fluid and prevent slippery surfaces around the working area. A slight amount of oil will initially be lost from the cylinder tubes - this is not a contributing factor in determining the location of internal leak.

A strong support should be placed under the upper boom before disconnecting any hydraulic fittings to prevent it from descending more than 15 inches at the turntable hinge point.

3. Tie upper boom control at lower control station in the "DOWN" (lower) position and leave the booms in the test position for approximately one hour. If boom creeps down over 12 inches, and oil flow from the rod end port fitting "C", the seals in the cylinder are worn and should be replaced. If boom creeps and oil does not flow from the upper end port, the check valve is defective and should be replaced or repaired.

---

**Figure 5-3. Cylinder Repair Diagram 1**

**Lower Cylinder - Lower Check Valve**

1. Place the hydraulic system in operation with booms in road travel position and a normal working load in platform. Attach a line or tape measure to the middle hinge point of booms to hang directly below (a tape measure is best). Operate lower boom control lever at ground control station to raise lower boom about 2 feet from road travel position, then raise upper boom away from lower boom to strike an angle between the two approximately 60 degrees. Shutdown the hydraulic system. Actuate the lower boom control lever at the ground control station to "DOWN" position. If the boom descends, the check valve is out of adjustment or faulty and should be adjusted or replaced. If the boom does not descend proceed with the remainder of the test.
2. Operate the booms to place them over the rear of the truck where the lower boom can be operated to its maximum lower level of depression below horizontal bottoming out the lower cylinder. The upper boom should be folded as near the lower boom as possible. Shut down the system. Disconnect the fitting ("A" on diagram 2) to break connection between check valve and base of cylinder. Place the system back in operation and operate the lower boom control to "DOWN" position and hold fully actuated for about 30 seconds. During this 30 seconds, if oil flows in a stream from fitting, the internal seals of the cylinder are worn and should be replaced. If oil does not flow from fitting, the check valve is defective or out adjustment and should be replaced, adjusted or repaired as required.

**WARNING**

Perform this test exactly as prescribed. Be sure not to remove or loosen any fitting other than the one called out and be sure not to operate the control to the opposite position from the described.

---

**Figure 5-4. Cylinder Repair Diagram 2**

**Lower Cylinder - Upper Check Valve**

1. Place the hydraulic system in operation and with a normal working load in the basket, operate the booms to raise the lower boom up to 10 degrees from the maximum elevation and upper boom at right angle to the lower and slightly less than parallel to ground level. Shut down the system. Operate the lower boom controls to "UP" position and hold fully actuated. If the lower boom raises toward its maximum elevation with movement of the control handle, the check valve is out of adjustment or defective. If lower boom does not move, proceed with reminder of this test.

2. Place system in operation. Raise the lower boom to its maximum elevation bottoming out the lower cylinder in fully extended position. Place the upper boom as near to the lower boom as possible. Shut down the system. Disconnect the fitting ("B" on diagram 2) to break connector between check valve and rod end of cylinder. Place the system back in operation and operate the lower boom control to "UP" position and hold fully actuated for about 30 seconds. If oil flows in a stream from the fitting the internal seals of the cylinder are worn and should be replaced. If oil does not flow from fitting, the check valve is defective or out of adjustment and should be replaced, adjusted, or repaired as required.
Perform this test exactly as prescribed. Be sure not to remove or loosen any fitting other than the one called out and be sure not to operate the control to the opposite position from the described.

MECHANICAL ADJUSTMENTS

Noise During Operation

If the "55SFF Aerial Platform" emits noise with accompanying jerky movements that cause may be cavitation in the pump which is traceable to low hydraulic fluid supply or a loose fitting in the suction line to pump, causing it to draw air. The remedial actions for low fluid supply and loose fittings in suction line are obviously simple, therefore, these possible causes should be the first thing checked when cavitation is suspected.

Pinion and Rotation Gear adjustment

Erratic turntable operation may be traced to excessive looseness in the gearbox drive chain or backlash between the pinion gear and rotation gear. Necessary adjustments should be made to correct these conditions when they occur.

If pinion is too tight against rotation gear rough operation will occur, if too loose it will cause excessive backlash.

After satisfactory adjustment is made, tighten bolts and jam nuts.

Leveling System

A mechanical type leveling system which operates on the parallelogram principle keeps the platform level at all times, regardless of boom movement. Normally the leveling arms should never need adjustment unless removed or replaced. Even if the arms are removed and the same ones replaced, it should only be necessary to adjust them with sufficient care to secure the end eye bolt in position to retain the original adjustment.

If new leveling arms, eye bolts, or leveling arm brackets are installed, readjustment may be necessary. All leveling arms in the system should be adjusted in the following manner at assembly.

1. Upper leveling rods are to be adjusted to exact boom length within +0 -1/2 turn of eye bolt and then shortened (1) full turn.
2. Lower leveling rods are to be adjusted to exact boom length within +0 -1/2 turn and then shortened 1/2 turn.

Because the adjusting eye bolt must be turned 1/2 turn at a time, we have installed the above mentioned +0 - 1/2 turn tolerance.

Eye bolts are wired, taped or otherwise marked to maintain the above adjustment until leveling rods are installed.
At Installation

Lower leveling rods are to be hooked up as adjusted if possible, with no more than 1/2 turn allowed for connection.

NOTE: It is preferred that the 1/2 turn allowance be taken in on longer leveling rod, however, each rod may be adjusted 1/2 turn if required, each in opposite directions.

If basket is not level with turntable as installed or kicked up slightly (when above preferred adjustment of rods has been done) check the leveling rod length to see that it matches the procedure described above.

Lower Leveling Arms
256" (21' 4") Pin to Pin

Upper Leveling Arms

GRAPHICAL SYMBOL DEFINITIONS

Your apparatus may use graphical symbols to indicate the function of switches, controls, gauges, or components. Study this section so you will understand the meanings of these symbols. For more in-depth explanations of the symbols you can refer to TC008 Graphical Symbols for Automotive Fire Apparatus available for download at FAMA.org.
